### CHANGES IN THE EXPORT OF AGRICULTURAL PRODUCTS FROM YUGOSLAVIA

SUMMARY:— I. *Agricultural exports from Yugoslavia*:— Changes in quantity. — Changes in value. — Principal countries of destination. — The principal agricultural exports. — II. *Causes of changes in Yugoslavian agricultural exports*:— The agrarian reform and the post-war period. — The world crisis and government intervention. — Development of a new trend of agricultural production. — Future prospects for Yugoslavian agricultural exports.

Approximately 81 per cent. of the population of Yugoslavia (some 15,600,000) are engaged in farming, while agricultural products averaged from 48 to 52 per cent. of total exports during the last twenty years. These figures show clearly that this essentially agricultural country is largely influenced in its economic and social evolution by the condition and development of its agriculture and, consequently, its agricultural exports.

During the last ten years trade between Yugoslavia and other countries has undergone a complete change both in quantity and quality, more especially as regards agricultural products. This transformation, due partly to agricultural and partly to other developments, has had both material and social repercussions (1).

The most notable change was in regard to countries of destination. Yugoslavian exports were still limited to central European markets but went to different countries. The causes of this evolution cannot be fully dealt with in the present article, but in order to give some idea of the changes that have taken place in the export of agricultural products from Yugoslavia it is only necessary to mention the *facts*, with a brief reference to the *causes* which have contributed to this change.

---

(1) For changes outside the sphere of agricultural production see, by the same writer: "The industrialization of agricultural countries of south-eastern Europe" in the *International Economic Review*, Brussels, July 1938, and "Triebkräfte wirtschaftlicher Strukturänderungen in Jugoslawien", *Weltwirtschaftliches Archiv*, Kiel, September 1938.

## I. — Agricultural exports from Yugoslavia.

### Changes in quantity.

The agricultural products of Yugoslavia vary considerably in quality and quantity from year to year. Wheat crops, for instance, vary between 11 and 37 million quintals and maize between 18 and 51 million quintals, while the total area under crops gradually increases in proportion to the increase in population.

Even in periods of poor harvests, however, Yugoslavia has never ceased to export wheat and maize. The export of other cereals is so unimportant that it can be disregarded. Even after the disastrous years of 1921, 1923 and 1927, when wheat production fell to 12, 16.2 and 15.4 million quintals respectively, and maize production to 18.1, 20.6 and 21.0 million quintals respectively, Yugoslavia's agricultural exports, consisting up to two-thirds of cereals, were very considerable.

Although Yugoslavia constantly exports cereals and other agricultural products the volume varies between very wide limits. During the years 1925-26 exports reached the figure of 14 million quintals per annum. After the scanty crops of 1937 they fell abruptly but rose again to 9 million quintals. After 1932, having fallen to 4,900,000 quintals they again rose to 9 million quintals. It is not surprising that an agricultural country, whose economic success depends to so largely upon natural factors, should have violent fluctuations; the remarkable fact is that the exports are never entirely suspended, as is frequently the case in other countries.

The quantities of various classes of exports each year are definitely interdependent. In one case only was this rule broken, viz., in the year 1935-36, when the export of animal products declined while that of vegetable products and of the products of agricultural industries rose. This was entirely due to the fact that sanctions were then being applied against Italy and may be regarded as the exception that proves the rule. Briefly, the flow of agricultural exports varies in volume between extremely wide limits but never entirely ceases: it shows on the whole a tendency to increase.

### Changes in value.

The position is not quite so simple and clear when it comes to considering the changes that have occurred in the *value* of exports of agricultural products. Such changes depend not only on Yugoslavian production but also largely on prices on the world market, which in their turn are affected by supply and demand. Partial independence of prices on the world market was possible for Yugoslavia only after trade with Germany had been regulated by the treaty of May 1 1934, which came into force on June 1 1934 and was supplemented by the additional agreement of May 1 1936. Previous treaties of the kind had been that with Italy of July 14 1924 supplemented with numerous additions in 1932, 1934, 1936 and 1937, and that with Austria (treaty of March

1 1932) and with Czechoslovakia (November 1928, supplemented December 10 1936). This independence could however be achieved only in respect of quotas and groups of commodities as fixed by these treaties, especially cereals, livestock and livestock products, eggs, poultry, fish, certain fruits, etc. Prices of all other exported agricultural products came under the direct influence of world market prices which were nearly always below production costs of Yugoslavian products. This was the case for alcohol, sugar, flour, chilled meat, butter, cheese (apart from "Kačkavalj" cheese which is not made in Western Europe), fats, beans, fruit, hops, hemp, tobacco, etc. Under the pressure of world market prices, it has been quite impossible to export certain products, such as alcohol, sugar and flour (this last up to 1937), and the other commodities just enumerated could be exported only to a limited extent.

The much greater fluctuations in the *value* than in the *volume* of the agricultural products exported from Yugoslavia are thus due to two factors: the price situation on the world market, in connection with which account must be taken of the considerable fluctuations in the value of the dinar at the period of inflation (1920-22) and of the deflation which followed up to 1925 and subsequently up to the stabilisation of the currency in 1931, and secondly, variations in the volume of the various exports, which in effect depend on variations in harvests.

The value of the exports of agricultural products was thus at its lowest level in 1920-21, amounting to some 800 million dinars, and at its highest level in 1925-26, viz., 5,960 million dinars; thus in the most favourable year the value was seven times what it was in the least favourable. It may be noted in passing that in 1924 the aggregate value of all Yugoslavian exports reached the highest figure from the creation of the State to 1937, viz., 9,538 million dinars and that in 1925 total exports were still worth 8,904 million dinars and were maintained at a level of about 6 to 7 milliards of dinars until, in 1933, the effects of the great depression brought exports down to a value of 3 milliards of dinars, to rise only gradually to 6,200,000,000 dinars in 1937.

### Principal countries of destination.

In world trade Yugoslavian exports have no special importance, as they represents barely 0.5 per cent. of the total. They cannot therefore exercise any influence on the world market and in consequence market conditions simply have to be accepted.

On the other hand, in Central Europe (understanding by this term Germany, Italy, Czechoslovakia, Poland and formerly also Austria) Yugoslavia is a factor which cannot be overlooked. With Hungary, Romania, Bulgaria, Greece and Turkey, Yugoslavia however forms a community of the "agrarian States of South Eastern Europe", which resemble each other in their economic and social structure; within this group trade in agricultural products is only considerable between Greece and the other Balkan States; between the other members of this group both the volume and value of such trade are insignificant.

The whole foreign trade of Yugoslavia gravitates towards Central Europe, about 60 per cent. of the value of its exports going to Central European countries and 60 per cent. of its imports coming thence. Only in the last few years has a change in the direction of foreign trade been to some small extent noticeable with the development of exports to the Levant and to other coasts of the Mediterranean (Algeria, Morocco, Tunisia, Malta, Egypt, Palestine). This trend of economic expansion may well continue, and so gradually free Yugoslavia from its economic dependence on Western Europe. For the time being no great attention is paid to such a strengthening of trade relations with the Near East, but it would be a mistake to ignore the possibility (1).

Total . . . 911.7 million dinars, or 70 per cent. of the value of total exports.

Up to the time of the application of sanctions against Italy, in 1935, Italy, taking 20 per cent. of Yugoslavian total exports, was constantly the principal market for Yugoslavian products, especially agricultural products.

(1) See by the same author: "Möglichkeiten der Umorientierung des jugoslawischen Aussenhandels" *Weltwirtschaftliches Archiv*, Bd. 39 Heft. 3, May 1934 Kiel.

In 1934 Austria came next with 16 per cent., Germany with 15 and Czechoslovakia with 11. In 1936 exports to Italy dropped to 3.1 per cent. only, while exports to Germany rose to 23.7, to Austria to 14.6 and to Czechoslovakia to 12.3 per cent. (1).

This change in the direction of exports due to marketing conditions continues: in the first half of 1938 the share of Germany (including Austria) was 35.8 per cent., that of Czechoslovakia was 9.59 per cent. and that of Italy 7.18 per cent. of the total exports of Yugoslavia. It seems likely that Germany will retain the first place which she holds in the foreign trade of Yugoslavia; this must be emphasized as one of the most important changes which have occurred in the export of agricultural products in particular. The accompanying figures show the extent to which agricultural products predominate in exports to Germany.

### The principal agricultural exports.

In addition to this trend movement in the exports of agricultural products from Yugoslavia, changes have occurred in the quantity and value and also in the destination of the various products exported. A short summary of these modifications will here be given.

*Cereals.* — All the export surpluses of the two principal cereals grown in Yugoslavia, wheat and maize, find markets in Central Europe. The wheat might be marketed entirely in the Mediterranean basin—which would be impossible for maize—but could be sold only at world market prices which, as already stated, are below production costs in Yugoslavia. There has been a perceptible change in the markets for Yugoslavian wheat in the course of the last ten years. While in 1928 out of 162,278 metric tons, 52,101 tons were sent to Austria, 61,686 to Czechoslovakia, 21,668 to Hungary and 22,016 to Rumania, these States almost entirely disappeared from the list of buyers during the period up to 1937 (only Austria still bought 3,319 tons). In their place, in 1937, out of a total export of 318,035 metric tons, 156,796 tons were directed to Germany, 134,162 tons to France, 8,000 to Italy and 5,000 tons to the Netherlands.

The explanation of this contrast is that in the statistics compiled account is now taken of the fact that cereals sent to Hungary and to Rumania do not remain in these countries but are immediately re-exported to the consuming regions of

---

(1) Among the Yugoslavian sources which have supplied the figures given, may be mentioned: (a) Statistika spoljne trgovine kralj Jugoslavije (Statistics of the external trade of the Kingdom of Yugoslavia). Years from 1926; (b) Poljoprivredna godisnja statistika (*Annual agricultural statistics* published by the Ministry of Agriculture from 1920; (c) Statisticki godisnjak kralj Jugoslavije (*Statistical Yearbook of the Kingdom of Yugoslavia*) from 1930; (d) Spoljna trgovina (*External Trade, Report of the Office for the encouragement of external trade*, only for years 1931 to 1933 inclusive.

Western Europe, Braila and Budapest being regarded merely as entrepôts. The large quantity purchased by France was temporary only. As normally France is in a position to cover fully her wheat requirements, and at times even has surpluses, it was unlikely that this marketing outlet would be permanently available for Yugoslavia. This was fully confirmed in the following year. For Germany the situation is different, as, especially since the annexation of the Austrian and Sudeten regions which cannot meet their own food requirements, Germany will have to supplement her own production of wheat, seeing that within the limits of the production campaign and the Four Years' Plan there is neither the possibility nor the intention of completely covering requirements. In addition, there is no German wheat suitable for the manufacture of the finest flours (OOG), as the hard, brittle grain of Yugoslavian wheat, like that of Manitoba wheat, is the product of a special climate not found in Germany. On this account special attention is paid in Yugoslavia to the production of hard wheat, with high gluten content. In place of the former numerous indigenous varieties and of the Prolific variety which used often to be exported and which has starchy grains relatively poor in gluten, distribution is now made so far as possible of seeds of selected early ripening varieties (Bankut, Sekacs and Dakota wheats), of good storage quality, and resistant to parasitic diseases. By this means the quality of wheat for export has been noticeably improved.

Some account will be given later of the measures taken by the Government for the standardization and grading of wheats for export and of the plans for further development of these measures. Here it is enough to say that constant attention is paid to the development and safeguarding of markets for Yugoslavian wheat surpluses at fair prices, and that Yugoslavia is determined in all circumstances to keep the Western European market.

Almost the same may be said of maize, three varieties of which are exported: the late ripening horsetooth maize, the ordinary Yugoslavian round-grained maize and the early Italian varieties (Cinquantin, Pignoletto, etc.). Wheat has however become largely independent of prices on the world market, as a result of agreements between Yugoslavia and Germany—which largely protects its own production of wheat by means of market regulation and by duties and allows Yugoslavia a share in this protection. This has not been the case with maize, and in consequence there is a much wider range of markets for maize, for nearly all the European countries purchase Yugoslavian maize. Whereas formerly (in 1927) out of the total quantity of 197,689 metric tons with a value of 337,200,000 dinars, Czechoslovakia took 121,357 tons, Austria 39,352 tons and Hungary 24,279 tons, in 1937 out of a total quantity of 725,196 tons with a value of 698,900,000 dinars Austria imported 239,411 tons, Denmark 167,010, Germany 123,054, Italy 22,727, Greece 19,086, the Netherlands 46,905, Morocco 16,387 and the United Kingdom 11,532 tons. This expansion of exports was especially due to the fact that, in 1936-37, Yugoslavia had a record harvest and was in a position, owing to the shrinkage of the supplies from the overseas countries, to obtain good prices and to secure markets which before had been inaccessible.

*Leguminous crops.* — The export of beans from Yugoslavia is of considerable importance. In 1928 exports amounted to 9,772 metric tons with a value of 55,000,000 dinars, of which exports to Greece were worth 25.8 million dinars and those to Italy 21.1 million dinars. In 1937 exports were 44,491 metric tons of a value of 107.1 million dinars. The leading buyers of this increased export were again Greece (34.6 million dinars) and Italy (21.1 million dinars) but also the United States (8.6 million dinars), Germany (8.4 million dinars), France (6.4), Brazil (1.4), Argentina (3.5), also Nicaragua, Guatemala and other South American States with smaller quantities. It is undoubtedly due to the exceptional quality of the Yugoslavian — small grained — beans that the export of this product has acquired a still greater importance than formerly.

*Fruit.* — The export of fruit is an important item in the trade of Yugoslavia, but the value of this export varies between even wider limits than in the case of cereals. It is a matter of long experience that the harvests of the most important and widely distributed fruit crop in Yugoslavia, *viz.* plums, are found to be as follows in the course of every seven years: one superabundant, two plentiful, two good and two poor; if the poor harvests are due to night frosts, it often happens that the entire crop is lost and in those years the regions affected have no plums at all. Fluctuations consequently occur in the quantity and value of fruit exports: in 1928 a total of 67,187 metric tons of fruit were exported with a value of 250.8 million dinars, while in 1937 scarcely half the quantity was exported, or 35,537 metric tons with a value of 107.8 million dinars. As already indicated, plums form the greater part of fruit exports from Yugoslavia, and in 1928 out of the total fruit exports 47,788 metric tons consisted of plums to the value of 175 million dinars, while the export of apples was 11,220 tons with a value of 31.2 million dinars, that of walnuts, 3,188 metric tons with a value of 23.9 million dinars and that of bitter cherries, from which the famous maraschino liqueur is made, 585 metric tons with a value of 9.7 million dinars. In 1937 when, not in all, but in the most important plum-growing districts, a late frost occurred, which destroyed the greater proportion of plum and apple blossom, the export of plums fell to 21,862 metric tons with a value of 63.9 million dinars, of apples to 7,400 metric tons worth 16.4 million dinars, of walnuts to 2,413 metric tons worth 10.1 million dinars and of maraschino cherries to 400 tons for a value of 1.8 million dinars. The year 1937 was far from being the worst fruit year, but these figures show the great fluctuations in Yugoslavian fruit exports.

Exports of grapes are much more regular, the average of the last few years amounting to some 2,800 metric tons with a value of about 9 million dinars, at first mostly to Austria and Czechoslovakia, now mainly to Germany. For apples the change in destination of exports was the same as for grapes, whereas for dried plums Germany had been the principal market before. In the last few years Poland and Denmark also became purchasers, while Czechoslovakia has bought almost the same quantities every year. Walnuts were formerly sent mainly to Austria, although Germany, Hungary and the United States bought up to about 4 million dinars each. Exports to Hungary and to the United States

have now almost entirely ceased, and Germany and Austria remain the principal customers. The greater part of the maraschino cherries went to the United States in the dried state, the only condition in which transport is possible.

*Industrial crops.* — Tobacco and hemp are now the only industrial crops exported in any considerable quantities from Yugoslavia. Speaking generally, there is a steady increase in the growing of industrial crops in Yugoslavia; the area under cultivation was 118,519 ha. in 1926 and 168,231 ha. in 1937. This increase however is not reflected in exports, for their value has fallen from 432.6 million dinars in 1928 to 399.5 million in 1937. This is due to the fact that although, owing to Government measures, to be later examined, the production of oilseeds has definitely increased — 6,095 ha. were under cultivation in 1926 and 39,586 ha. in 1937 — the seeds obtained have been utilized in Yugoslavia itself for the manufacture of oils, instead of being exported. Only one kind of oilseed has been exported of late years, the soybean. Several thousand tons of these were exported during the last few months of 1938, almost exclusively to Germany, which is giving systematic encouragement to this cultivation in the Balkans with excellent results in Bulgaria, good in Romania but up to 1938 not very satisfactory in Yugoslavia. In 1938 a larger number of growers became interested in soybean growing. Their results were so satisfactory that the prospects of the extension of this valuable crop have decidedly improved. As Germany guarantees in advance the purchase price for a series of years and at a level ensuring a certain profit even for crops which are below the average anticipated, soya exports may be expected to increase in the future.

In the former Southern Serbia the *tobacco* crop is of special importance. From pre-war times the tobaccos of these districts, known as "Macedonia tobaccos", were as well known and appreciated as those of Herzegovina. As the sale of tobacco is a State monopoly in Yugoslavia, production and export are both under State control. In consequence the extent of the tobacco area depends always on the degree to which the Monopoly has been able to place the surplus production on the foreign market. According to the market situation, the area planted with tobacco has varied between the extremes of 21,264 ha. (in 1931) and 6,418 ha. (in 1934). On the other hand, the value of tobacco exports was 46,100,000 dinars in 1925 and 1,095,000 dinars in 1932. For the year 1937 the volume exported was 3,632 tons to a value of 109,100,000 dinars, of which much the greater proportion (to a value of 102,100,000 dinars) was bought by Czechoslovakia. It is stated that Germany has announced her readiness to purchase in future all tobacco in leaf which Yugoslavia has for export, and hence the prospects for the export of this crop are good.

This assured marketing outlet is the more welcome, as it is in the relatively over-populated districts, *i.e.*, in the Southern Karst region, that tobacco does best and is of value to the poverty stricken population as the product most sure of a market and bringing in the highest wages for the labour required, of which there is always a surplus available.

The export of *hemp* is of increasing importance to Yugoslavia. Originally the quality of Yugoslavian hemp was much inferior to that of Italian hemp. By

importing seed from Italy and by improving the retting equipment and the subsequent treatment of the hemp up to the semi-manufactured stage (stripped hemp, etc.) much has been done to enable Yugoslavian hemp to compete effectively on the market. In consequence the volume and value of hemp exports have considerably increased: whereas in 1928 not more than 8,523 metric tons were exported to a value of 49.9 million dinars, the quantity in 1937 rose to 20,312 tons for a value of 162.2 million dinars. In 1928 the leading buyers of nearly equal quantities in each case were Austria, Hungary and Germany. In 1937 a decided change had come about: Germany now stands at the head of the list of purchasers of hemp, to a value of 49.8 million dinars. The United Kingdom comes next, as a new and important customer, with 37.9 million dinars, then Austria with 25.3 million dinars, Czechoslovakia with 12,100,000 dinars and Hungary with 7.2 million dinars. It appears that England is anxious to attract hemp exports from Yugoslavia, a prospect offering advantages to exporters, as England pays in currency. The relatively low prices on the world market, however, give rise to difficulties in hemp-growing in Yugoslavia itself, and the crop is no longer so remunerative as it was formerly, when the net returns were considerably higher than those from cereals, and especially from wheat growing. Since, as a result of advantageous trade agreements, it has proved possible to maintain the price of wheat above cost of production, hemp-growing, which is liable to great variations in yield and in quality of crop, offers less advantage than formerly, especially as it requires much more labour than wheat, and this consideration is of great weight for the farms obliged to employ hired labour. In consequence, in spite of the prospects of improved marketing, Yugoslavian hemp export has not a completely assured future, and is likely to experience considerable fluctuations.

*Livestock products.* — The second group of Yugoslavian agricultural exports is that of livestock products. With these products also considerable changes have taken place during the last ten years, both in the volume and value of exports and also in countries of destination. It cannot be maintained that these changes are due to changes in the structure of Yugoslavian agriculture; they were actually the result of the crisis in the years 1930-34. Nevertheless, the quality of exports of products of animal origin, ranging from live animals to the products of the processing of meat, to milk, fats, eggs, feathers, etc., have been considerably improved since the founding of the new State. The results obtained in the improvement of breeds of horses, cattle and pigs have been especially noticeable, since efforts in this direction could be based on earlier successes. The great landowners in the northern regions of Yugoslavia had many exceptional breeds, some of which were renowned beyond the frontiers of the Austro-Hungarian monarchy. The Lipizzan horses, the red-brown spotted cattle (Simmental), the fat Mangalicza pigs and the merino, Electoral and Rambouillet sheep were all represented here by well known pedigree stock. It is much to be regretted that when the agrarian reform was being carried out the best breeds were destroyed indiscriminately without regard to the future and that it has become necessary to build them up again on what was left of the former stock.

Comparing the development of Yugoslavian exports of animal with vegetal products, it is observed that the trends of volume and value in each case are nearly parallel although the fluctuations in the case of vegetal product exports are less marked, as stock farming cannot be immediately adjusted to the variations in crop returns. This adaptation is most readily made for pig breeding the extent of which depends in Yugoslavia on the supplies and the price of maize, which is the principal feed for fattening pigs. Sheep numbers are also reduced or raised by owners of flocks according to the production of hay and straw for winter feeding. Any change in cattle numbers is made less easy by the organization of the farm, the crop rotation and the requirements in manure, and a change is still more difficult in the case of farm horses. This fact explains the much wider variations in pig and sheep exports, as compared with those of cattle and horses, and accordingly the value of the exports of animal products remains at a more stable level than that of the exports of crop products. In any case, once the crisis of 1930-34 was over, there was a steady rise in value from 1933-34 and in volume from 1935-36. These latter years also mark the beginning of an improvement in the prices of animal and vegetal products on the home markets. After the price fall of 1931-32 and the very low price level on the world market in 1933-34, prices gradually recovered and rose above the level of prices on the world markets, rapidly in the case of crop products and somewhat more slowly for livestock products.

*Horses* exported from Yugoslavia may be classed in two groups: light draught horses (Lipizzan, Nonius, Anglo-Norman and English semi-light horses) and heavy horses of Noric or Belgian origin. The former are purchased by foreign countries mainly for army purposes, the latter mostly for slaughtering. Of the total exports of horses, amounting in 1928 to 38,184 head for a value of 8.94 million dinars, much the larger proportion was sent to Italy (28.8 million dinars) and to Greece (25.7 million dinars). In 1937 however out of the 25,913 horses exported to a value of 63.8 million dinars, the value of exports to Italy and Greece was only 5 million in each case. On the other hand, Austria imported to a value of 32 million dinars, Germany 4.7, Switzerland 5.6 and Hungary 2.4 million dinars. More than half the horses exported to Austria and to Hungary were intended for slaughter.

Exports of *cattle* were at one time (1928) mainly composed of oxen (59,758 head), the number of bulls (17,176) and cows (17,687) and heifers and bullocks. (17,389), with a total value of 289.8 million dinars, being smaller. The largest proportion, to a value of 126 million dinars, went to Italy, while Austria came next with 108 million dinars. Greece imported cattle to a value of 44.6 million dinars and, what is especially remarkable, Malta to a value of 7.2 million. In 1937 the composition of the cattle exports remained nearly the same, but the total number fell to 80,481 head and the value to 169.8 million dinars. Among the importing countries Italy, in spite of sanctions, again heads the list (90.2 million dinars); next come Germany and Switzerland with 13 million each, Austria with 11.5, Greece with 7.5 and finally Malta with 9.3 million dinars. Stress is again laid on this latter country because it is no longer the only country in the Mediterranean basin to have increased its imports

of Yugoslavian cattle. Besides Malta, Libya has imported to a value of 1.5 million dinars, Egypt 2.1 and Palestine 14.8, in all a value of 28.4 million dinars. It has already been noted that Yugoslavia shows a tendency to re-direct her foreign trade from the West towards the East. The instance just given illustrates clearly enough how far this tendency might be pushed if pursued systematically.

Greece is still the only country purchasing *sheep*, in spite of many efforts to capture the French market; the value of Yugoslavian sheep imported into Greece during the year 1937 amounted to 35.7 as compared with 116.6 million dinars in 1928.

As in the past, Austria still provides the principal market for *pigs*. Her imports from Yugoslavia for 1928 of 207 million dinars were almost the same as the imports of 210.8 million in 1937. Next in order comes Czechoslovakia, whose imports for the years 1928 and 1937 were valued at respectively 100.4 million and 142.8 million dinars. Italian imports of live pigs from Yugoslavia rose during the this period from 9.5 to 28.5 million dinars and those of Germany from 0.7 to 40.6 million dinars. In addition to the importation of pigs, Austria and Italy imported from Yugoslavia in 1928 pigmeat to the value of 46.0 million and 16.5 million dinars respectively, but in 1937 Austria's imports had fallen in value to 21.3 million dinars while Italy scarcely figured among the purchasers. Germany, on the other hand, imported pigmeat to the value of 59.7 million dinars. There should be an appreciable increase in this figure owing to the latest negotiations (October-November 1938) with Germany and Italy, but this will probably take the form of chilled—not frozen—pork which, thus preserved, is easily transportable to the great centres within reasonable distance, where it is consumed. As the temperature of chilled meat is between 2° and 4° C it is not frozen and may be regarded in all respects as fresh meat. Modern methods of refrigeration make it possible to transport meat at that temperature from Yugoslavia to Germany, as far as the Main and the Danube, and to Italy, as far as Milan, without undue transport charges. It can also be transported to Berlin, Frankfort-on-Main, Paris and Turin at a cost which certainly enables competition with overseas frozen meat. It is therefore reasonable to anticipate that in the future this method of transporting and utilizing Yugoslavian meat will play an important part in the export trade not only in meat but also in poultry, game, eggs, fruit and similar products (1).

Eggs and *poultry* are extremely important items in Yugoslavian exports since they represent the chief source of income for small peasant farmers: in some cases they are the only link with the market and the only means of obtaining ready money for working expenses. It may be confidently asserted that the price of eggs on the world market is as important for about half the Yugoslavian peasant farmers as the price of wheat and maize is for the other half.

---

(1) As regards the position and prospects of the trade in meat seen the monograph "The International Trade in Meat" published by the *International Institute of Agriculture*, Rome, 1936.

This is readily understandable, as these small farmers are obliged to supplement their own production by purchases and need ready money to buy the food-stuffs which their farms do not supply. The stagnation on the poultry and eggs market, which was partly due to the general crisis and partly to the constantly varying clearing arrangements, had disastrous results for the poor and very poor small farmers: the price of eggs over this period fell from one dinar (the normal price per egg) to a fifth of that sum and then lower still. These farmers have not yet fully recovered, although in 1938 egg prices dropped below a dinar only during the summer, which is the season of largest production of eggs.

Certain changes have occurred in the course of these years in the destination of poultry and egg exports from Yugoslavia: in 1928 a total of 8,469 metric tons with a value of 131.8 million dinars and in 1937 a total of 14,130 metric tons with a value of 170.8 million dinars were exported to the following countries:

	Austria		Germany		Italy		Switzerland		England	
	Tons	Million dinars	Tons	Million dinars	Tons	Million dinars	Tons	Million dinars	Tons	Million dinars
1928 . . . . .	3,377	51.1	1,334	19.9	2,233	35.4	862	14.2	316	4.8
1937 . . . . .	1,908	21.7	4,739	55.1	3,856	50.0	1,378	19.7	2,351	29.4

The positions of Austria and Germany have been reversed; whereas formerly Austria was by far the largest buyer of poultry and especially of young poultry, it is now Germany which imports fowls and young poultry in nearly equal quantities. It may be assumed that the ratio between the two kinds of poultry, killed or alive, will remain the same after the union of the two countries. It is of interest to observe that England now buys very large numbers of turkeys; out of 2,351 tons with a value of 29.4 million dinars as shown in the poultry statistics, 2,179 tons with a value of 27 million dinars consisted of turkeys (1937), while in 1928 their value was only 4.8 million dinars. There is a very marked increase in sales to Italy, in spite of the difficulties caused by the veterinary control and in spite of sanctions. There is also an increase for Switzerland.

In 1928 exports of eggs were 24,524 tons with a value of 467.9 million dinars. Unfortunately exports were not maintained at this high level. In 1937 they fell to 12,264 tons, or one half of their former volume and to a value of 117.9 million dinars, or one fourth of their former value. Thus there has not only been a reduction in quantity but also a price fall of some 50 per cent., which is much to be regretted in the interests of the Yugoslavian small farmers who have a hard struggle for their livelihood as it is. This price fall is mainly due to the German regulation of the market in respect of grading of

eggs by size and weight, as only in certain districts do Yugoslavian poultry-breeders keep birds for breeding purposes, the eggs of which meet German requirement. The very large majority of eggs weigh less than from 55 to 60 grammes and are not suitable for export. Attempts have been made to remedy this by removing the contents of eggs that are too small from the shells and exporting them in jars. In this way 664 tons were already exported in 1937 with a value of 7.1 million tons and during the first six months of 1938 there was an export of 1,862 tons with a value of 22.2 million dinars. It may be expected that the technical improvements which are being introduced into this method of handling eggs will make it possible to export much larger quantities (1). In addition to Germany, which in 1937 imported eggs in the shell to the value of 43.4 million dinars and eggs in jars 7.1 millions, England imported to a value of 12.9 million and Switzerland 28.5 million dinars.

During the first six months of 1938 there was considerable expansion of imports of Yugoslavian eggs into England, eggs in shell being imported over that short time to the value of 18.5 million dinars and eggs in jars to 9.9 million. In view of the keen interest shown by England in the expansion of trade relations with the countries of Southern Europe, a further increase in this export to England may be anticipated, particularly as eggs are one of the few farm products able to meet competition at world prices.

Among other livestock products pig fat, of which only very small quantities (40 tons) were exported in 1928, has become an important export item. In 1937 exports totalled 8,333 tons with a value of 122.5 million dinars, mainly to German (74.1 million) and to Czechoslovakia (24.4 million), but also to England (14.9 million dinars). A considerable increase in the export of bacon has also occurred. The quality of this article of diet, which is very rich in calories, is excellent in Yugoslavia and is increasingly in demand abroad. Many efforts have been made to obtain a market in England for exports of bacon, but so far without success, and the same is true as regards export of hams, sausages and other preserved meats in any large quantities, although the required quality undoubtedly is to be found in Yugoslavia since there are plenty of fat and lean pigs. The total value of exports of these products in 1937 was 41 millions dinars as compared with 14.2 million in 1928. In view of existing possibilities this amount must be considered too low; the encouragement of the *meat industry* remains an urgent necessity.

Among articles of export of *agricultural industries* may be enumerated wheat flour, bran and fodder meal, cheese (Kackalj), olive oil and wine. Considerations of space however make a detailed treatment impracticable.

Among other agricultural products, exports of hides and skins of cattle, calves, sheep and goats are on the increase, both in volume and in value. In 1928 exports amounted to 4,207 tons valued at 107.2 million dinars, while in 1937 exports were 4,425 tons with a value of 137.6 million dinars. Generally speaking, exports of cattle hides are rapidly declining (in 1937 the value was only 3.8 million dinars) while those of skins of calves, sheep, lambs and goats are steadily increasing. The principal buyers are Czechoslovakia (for the large glove industry), the United States, the Netherlands, Hungary, Germany and Italy.

\* \* \*

During the first nine months of 1938 there was no noticeable change in the proportions of Yugoslavian exports, nor in the countries of destination, but a considerable decrease in volume and value may be observed. The value of the exports of agricultural products in millions of dinars during the months from January to September (inclusive) were as follows:

	Jan.-Sept. 1938	Jan.-Sept. 1937
	million dinars	
Wheat . . . . .	110.0	515.0
Cattle . . . . .	56.0	126.3
Pigs . . . . .	245.7	202.7
Hides and skins . . . . .	76.6	115.4
Hemp . . . . .	105.4	142.4

The reasons for this decline, in spite of production remaining at the same level, will be examined in the following pages.

## II. — Causes of changes in Yugoslavian agricultural exports.

### The agrarian reform and post-war period.

In the foregoing statement the year 1928 has throughout been compared with the following years, the reason being that 1928 marks the beginning of the decade which displayed certain definite trends and for which relatively trustworthy statistics on exports are available.

Since its foundation on December 1, 1918, the Kingdom of the Serbs, Croats and Slovenes had, like all the victor States, to pass through all the post-war phases. Conditions differed only in this respect, *viz.*, that Serbia was completely devastated, stripped of all means of production, its few industries ruined, railways and roads destroyed and livestock, seeds and all farm equipment disappeared. The former territories of the Austro-Hungarian monarchy which were grouped to form the joint Kingdom had suffered less or even not at all from the effects of war, but their export surpluses which before had gone to the monarchy were now directed to Serbia and in consequence there was a complete change in the former trade channels of these agricultural products.

In the following years, during which Serbia recovered with the surprising rapidity with which other agricultural countries (1) also recovered, all the

---

(1) For Bulgaria see: DANAILOW G. T. *Les effets de la guerre en Bulgarie*. Published by the Donation Carnegie Paris.

agricultural products which the new Kingdom could in any way dispense with began to be exported increasingly to many countries of Western Europe. Germany at that time took only a very small proportion of these exports. Exporting became so remunerative and the risk of pushing exports too far became so pressing that the Government introduced export duties: for example, in 1925 the duty on wheat for export was 15.60 dinars per 100 kg., on cattle 180 dinars per head, on pigs 360 dinars up to 70 kg. of live weight and 192 dinars for a higher weight, on cattle hides 960 dinars per 100 kg., on wool 760 dinars per 100 kg. These duties were shortly afterwards abolished as they impeded any export (1). The inflation which soon followed and the subsequent deflation had a very diverse influence on foreign trade of Yugoslavia in general and on that in agricultural products in particular.

The fluctuations in the monetary unit, *i.e.*, the paper dinar which was not covered by gold, scarcely permit of comparison between the volume of exports of these years with that of the following years, and in respect of value excludes comparison altogether. It is only since 1925, the year in which the stabilisation of the dinar on a gold basis was seriously attempted, being later established by law in 1931, that the figures relating to the value of Yugoslavian imports and exports can be freely compared.

Besides these changes in monetary policy, profound changes have occurred in the structure of agriculture within Yugoslavia.

On February 25 1919, the Regent (afterwards King Alexander I) issued a decree-law containing temporary measures for *agrarian reform*. These measures remained in force for ten years and were not definitely superseded until the years 1931-34. In his plan for agrarian reform the Regent was prompted by a spirit of humanity and political wisdom but, unfortunately, when it was carried out, the large estates were not used to benefit the ordinary family farmer – the real backbone of every nation – but were divided into innumerable dwarf holdings. So limited was the area of these holdings that even the largest were inadequate to support a family; obviously, therefore, they could not fulfil the functions of the average family farm, still less of the former large estates. Hence there was an appreciable fall in the export of agricultural products, which had previously been obtained from the large estates and were of excellent quality. The actual figures are given in the following table:

*Exports of Cattle and Pigs.*

(1921-1925)

	Number	
	Cattle	Pigs
1921 . . . . .	133,535	476,293
1922 . . . . .	128,362	301,268
1923 . . . . .	235,979	293,497
1924 . . . . .	186,903	219,335
1925 . . . . .	131,456	201,282

(1) See DRAXLER, B. *Die Landwirtschaftskrise im östlichen Donaauraum*. Petrovgrad (Yugoslavia), 1936.

Exports increased when the large estates were being broken up and their livestock had to be disposed of. There was subsequently a rapid fall both in quantity and quality; indeed, as regards the latter, the former high standard has never been regained.

Exports of agricultural products were similarly affected by the agrarian reform. Although there was an appreciable increase during the years 1925-26 owing to exceptionally good harvests, during the following years the value of exports declined steadily although the harvest yields over the period were nearly uniform. This fall in value was due to the fact that the selected and standardized products of the large estates were superseded on the market by ordinary peasant production which could not successfully compete with foreign cereals in Central Europe (1).

### The world crisis and government intervention.

The general fall in cereal prices on the world market, which began in 1929 and was the starting-point of the world economic crisis, added to the difficulties brought about by agrarian reform in the disposal of agricultural products. So serious were these difficulties, especially in regard to wheat, that they finally became intolerable for the peasantry, which represents the greater part of the Yugoslavian population. Prices fell from about 400 to 70-80 dinars per quintal. Moreover the proportion of his produce required from the family farmer for taxes amounted to four or five times that of pre-reform days. The price-relationship between agricultural and industrial products changed to such an extent that the latter were beyond the means of the peasantry. The purchasing power of whole masses of the population fell almost to zero and a situation arose which was intolerable both economically and politically. In view of this state of affairs the Government embarked upon a course of action calculated to have a decisive effect on the further evolution of agriculture in Yugoslavia, as also on the export of agricultural products. It intervened officially in the formation of prices, first of *wheat* and later of other agricultural products, thus introducing a new element into the system of unregulated supply and demand which had existed till then (2). It was also necessary to take action for the suppression of usury, which always gains ground in the country in times of crisis, and of intermediary trading, which lowers the price to the detriment of producers. In the hope of achieving all these objects the Government introduced the law of July 10, 1931, on the *internal wheat trade*, and that of June 27, 1931, on the *monopoly of wheat exports*.

---

(2) For further details as to the regulation of wheat-prices in Yugoslavia see V. PRYOR's study: „*Die Weizenregulierung in Jugoslawien* ". *Weltwirtschaftliches Archiv*. 45 Bd., Heft 3, Kiel, 1937.

These enactments were preceded by the formation of a Central Board for the Export of agricultural products (in the first place only wheat); this Board was set up under the name of "Prizad" as a privileged joint-stock company, the State holding 81 per cent. of the shares, and with an initial capital of 15,000,00 dinars (Law of April 15 1930). The function of the "Prizad" was at first to effect price regulation on the home market by purchase of wheat and wheat sales abroad, and to cut out as far as possible the large foreign firms which had up to then been exercising a semi-monopoly of export business. The small initial capital and faulty management resulted at first in complete failure of the new institution; when however the Government was obliged to have recourse to the enactments (of 1931) mentioned already, the "Prizad" was entrusted with the carrying out of the necessary measures, and from that time on its importance for agriculture and the export of agricultural products from Yugoslavia steadily increased. Actually, these enactments proved, as regarded internal trade, to be not merely useless but directly prejudicial; they expired, however, on July 1 1932 as they had become superfluous. It was in fact quite clear that a direct control of the price of wheat to be consumed *within the country* was unnecessary so long as precautions were taken that enough cereals remained in the country for the food of the population and for sowing, together with a certain reserve, while all surpluses likely to lower prices were withheld and disposed of. In this way the internal price is automatically brought to the level of the export price, provided the pressure of surpluses is removed. To ensure this removal is now the business of the "Prizad". The management of the "Prizad" has been thoroughly reorganized and since then it has not only undertaken this difficult task with efficiency but in the last three years has achieved practical results.

According to the trade returns for 1937 the "Prizad" bought in that year 102,700 metric tons of wheat with a total value of 184.7 million dinars; in 1938 up to end of December 184,350 metric tons were purchased at the price of from 150 to 170 dinars, as compared with which the world market prices in Liverpool and Rotterdam for spot wheat varied around 65 dinars per 100 kg. In 1937 the "Prizad" also exported—for the first time since the complete breakdown of exports in 1925—142,000 tons of flour, and also 26,000 metric tons of bran. In addition the "Prizad" purchased for export some 208,000 metric tons of maize, 1130 of fruit (fresh and dried plums), 1150 of beans, 9450 of oilseeds and 47,880 loads of opium. Marketing of all oilseeds is regulated by the "Prizad" and it is anticipated that several other crop products will also come under its control. Since the establishment of the "Prizad" it has been possible to maintain wheat prices above those of the world market. In consequence, as already noted, the internal price was maintained as high as the level of the export price, and indeed even rose so far above it that the "Prizad" from November 11 1937 up to the time of the new harvest in 1938 bought no wheat at all, as the price had risen to 240 dinars per quintal, while the world market price remained much lower.

The higher prices could be paid by the "Prizad" because the wheat was marketed in States (Germany, Italy, Austria, Czechoslovakia) which had

enacted marketing regulations and also maintained their internal wheat price above world market parity. The preferences in respect of clearings and quotas, established by agreement in the trade with these countries, enabled the "Prizad" to acquire in the past trading year 76.9 million dinars, which sum was assigned to the fund for the further encouragement of exportation.

In the meantime there has been a considerable increase in the funds of the "Prizad": a credit of 300 million dinars has been guaranteed by the Government, including 250 million for cereal transactions, 30 million for opium and 20 million for oilseeds. The purchases have been to an increasing extent effected through co-operative organisations, namely up to 7 per cent. of all purchases in 1934 and 23 per cent. in 1937. The grain trade is however the principal buyer for the cereals to be exported through the "Prizad", as only the trade is in a position to grade, by cleaning and sorting, the cereals consigned by growers, and thus obtain an exportable product.

The lack of warehouse accommodation has so far prevented the "Prizad" from tightening up the purchasing organization and from giving more effective assistance to the co-operative organisations. By an Order with the force of law of June 14 1938 a special joint-stock company has been set up in Belgrade under the name of "Silos A. G." with an initial capital of 220 million dinars which may be raised by means of credits to 800 million dinars. This company is to establish elevators throughout Yugoslavia for the storage and proper marketing of cereals, and when required also of fruit, eggs, opium, cheese, etc., according to local requirements. In the first place large elevators with a capacity of from 1000 to 1500 truckloads are to be erected in the districts producing the best wheats for export, as also in those areas where the production of breadstuff cereals is insufficient for local needs and requires to be supplemented. Besides these, intended primarily for stocks, as large a number as possible of smaller joint co-operative storehouses with less than 500 truckloads capacity are to be established with the help of subsidies and other forms of encouragement. Finally the "Silos A. G." is also to construct refrigerating plants for perishable goods such as fruit, vegetables, eggs, etc., and to undertake the proper marketing and transport of these. Bills are issued on warehoused commodities which can be discounted by the State banking institutions up to 75 per cent. of their value.

Provision has been made for close collaboration between the "Prizad" and the "Silos A. G.", so that the two organisations will support each other as far as possible. It should thereby become possible for Yugoslavian agricultural products intended for export to be marketed in future at the best prices obtainable and with the utmost rapidity, to be purchased from the growers in large quantities of uniform quality, and finally to be suitably standardized and graded for export.

The effect of the work of the "Prizad" on wheat prices is best shown by the fact that, as already indicated, the price of wheat before that organization began operations had fallen below 100 dinars per quintal, while before the 1938 harvest it had risen to 220 dinars. It is true that this rise has certain social disadvantages, as the consumers of wheaten bread, the town population,

industrial workers, and a small proportion of the farming population who supplement the more generally used maize meal by purchases of wheat flour, have to meet this increase in the cost of living without any chance of recouping themselves in other ways.

The cost of living index rose from 60 in 1934, when it was on a gold basis, to 78 at the end of July 1938 (the increase reckoned in dinars is from 860 to 1109 dinars) (1); that of foodstuffs (1926 = 100) from 63 to 84 (2). On the other hand the national income derived from agriculture rose from 19 milliards of dinars in 1934 to 22 milliards in 1937; in other words, the purchasing power of the farmers was increased by that amount and accordingly the whole national economy reaped the benefit. The value of the wheat crop rose over the same period from 1273 to 1862 dinars per ha. Since 81 per cent. of the inhabitants of Yugoslavia belong to the farming classes, the rise in wheat prices cannot in itself be regarded as unfortunate, although it may involve consequences undesirable from other standpoints.

### Development of a new trend of agricultural production.

The necessity of a change in the general direction of Yugoslavian agricultural production thus becomes evident. Such a change is undoubtedly inevitable for various reasons which for considerations of space cannot here be detailed. One only may be mentioned, the need for counteracting the unfavourable consequences of overpopulation in the rural districts by employing more labour in the processes of production. Instead of production a surplus of wheat and maize, the object should be to grow crops which require more intensive and better paid labour than do these two cereals. At the present time wheat and maize crops cover an area much larger than that under all the other crops. The country is thus still under the régime of a primitive cereal cultivation and there is no opportunity of introducing a scientific and intensive rotation. A more intensive farming would include the cultivation of oilseeds, tobacco, sugar-beet, fibre crops and other industrial crops. As however the increase in the prices of wheat and maize have had the effect of reinforcing and encouraging the conservation of the Yugoslavian farming class, all the measures taken by the Government for an intensification of agriculture are hampered and rendered difficult of application (3). The Government is fully aware of the position and anxious to render the export of agricultural products less dependent on wheat and maize, and has accordingly issued a series of orders fixing minimum prices for such crops as it is thought advisable to grow with this purpose in view, especially oilseeds (colza, rape, ca-

stor, sunflower and — for German requirements — soybean) as well as cotton and rice. As these products are not — with the exception of soya — intended for export, they will not be discussed there, although it may be remarked that the increase in their production may in the near future affect the composition of Yugoslavia's agricultural exports, and in the case of cotton and rice, imports.

### **Future prospects for Yugoslavian agricultural exports.**

Work similar to that of the "Prizad", particularly in regard to exports, is also carried on in the export of livestock and livestock products by a department of the Institute for the Promotion of Yugoslavian Foreign Trade in Belgrade. The powers of this Institute, it is true, are not so far-reaching as those of the "Prizad", as it can transact no business on its own account and has no working capital, but the whole of the trade with countries with which Yugoslavia has concluded clearing and quota agreements is in its hands, and it thereby systematically exercises control over the export market, which already works with remarkable smoothness, especially in regard to animal products. It is due to the work of this Institute that new markets for Yugoslavian exports have been found and maintained in the Mediterranean basin. It may also take the credit for the fact that these products have become known in Northern Europe, England, the Netherlands and Belgium, and that their producers are endeavouring to give permanence to these trade relations.

In the two institutions, the "Prizad" and the Institute for Promotion of Foreign Trade, Yugoslavia has set up central offices for the organization of its foreign trade, which in some degree are opposed to the liberal conception of trade. Till quite recently a completely free trade policy was followed in Yugoslavia; in all trade agreements the most favoured nation clauses were respected even when their application was prejudicial to the interests of the country. The discriminations made by nearly all States against the most favoured nation clauses finally forced Yugoslavia also to apply discriminations against States which make use of these clauses for their own benefit without giving any advantages in exchange. Hence Yugoslavia was finally reduced to a system of one-sided protectionism, export quotas, payments by means of clearings, barter of commodities, etc., in short, to the adoption of all those methods which are the features of a modern planned economy.

The experience of Yugoslavia has been that by means of this process the national income has increased, the real income of *all* productive classes has been raised and the economic capacity definitely strengthened. It is to be assumed that Yugoslavia will continue with the economic policy which is now being pursued.

Yugoslavia is now on the way to a comprehensive industrialization. Efforts are being made to increase the volume and value of the exports of raw materials and semi-manufactured goods, that is to say, of goods which entail more labour in their production than agricultural products; the object is also to extend the means of production and branches of production beyond the limits of agriculture pure and

simple. This policy is being effected for a number of political and economic reasons which make industrialization, within the practicable limits of the home production of raw materials and with due regard to the protection of the land, appear *desirable*. It is however not merely desirable but also *essential* that Yugoslavia should build up industry to the greatest possible extent, so as to provide employment for such surplus population as can no longer produce sufficient supplies of foodstuffs, and to divert labour to manufactures. For reasons of space statistics in regard to the overpopulation in rural areas of Yugoslavia cannot here be quoted and in this connection reference must be made to publications already available (1). For the purposes of the present enquiries it is enough that this necessity should be clearly recognized, as well as the fact that industrialization is in practice the shortest and most effective method of eliminating, so far as possible, the disastrous results of overpopulation (malnutrition, high mortality, intellectual stagnation, lowered purchasing capacity, decreased taxation yield, etc.). As there has been an increase in the number of workers in industry from some 225,000 in 1929 to about 700,000 in 1937, it is at once evident that these former self-suppliers, once detached from the land, are now becoming consumers of all kinds of agricultural products and that this consumption must primarily be at the expense of the former export surpluses. These latter must therefore diminish in direct proportion to the increase in the numbers of industrial workers in Yugoslavia. The reduction in exports of agricultural products will be seen especially in the most important foodstuffs: bread cereals, meat, beans, fruit, etc. These will tend to dwindle as the production of commercial crops (hemp, oilseeds, tobacco), early vegetables, fruit, etc. increases over and above home requirements. The labour forces now lying idle on the land would be better employed in such types of cultivation and at the same time the drift to industry would be less marked. As a final result however a decline in the export of agricultural products is to be anticipated as the consequence of increased consumption within the country. As these products mainly go to countries which have quota and clearing agreements with Yugoslavia, the importance of these countries will probably become less for Yugoslavia, unless they increase their purchases of the commercial crops enumerated above. In any case it is to the interest of Yugoslavia to export increasingly by preference such agricultural products as can meet the competition of the world market, and for which exporters can obtain currency payments without restrictions: chilled meat, eggs, poultry, fruit, hemp, dairy products, etc. Such a reorientation requires much time and persistence, involving the transition of Yugoslavian agriculture from the cereal economy now prevailing to a more intensive crop rotation combined with an increase in the cultivation of fodder crops and in stall feeding. It also demands a higher level of education and the development of co-operation, etc., all of which need for their realization time and patience.

There remains one other course to pursue: a change in the direction of exports from the West to the Near East and South, to the Mediterranean basin. Mention has already been made of this change and it is unnecessary to say more as to the prospects except that they depend on the extent to which Yugoslavia can place on these markets *all* its agricultural products — including pigs and maize — with very low costs of transport and time of transit. It remains to be seen whether Yugoslavia will resolve to take advantage of this opportunity. In any case such a change in direction of exports again requires much time and persistence and the overcoming of immense difficulties for the conquest of a market previously in the hands of powerful rivals. But just as the little Serbia in 1906, after Austria-Hungary suddenly denounced the trade agreement in existence till then, immediately found new markets for nearly all the products previously sent to Austria-Hungary, so now a change in the direction of Yugoslavian exports can be organized and realized within a new economic or political framework.

Dr. O. v. FRANGEŠ.

## AGRARIAN REFORM AND THE RECENT EVOLUTION OF LATVIAN AGRICULTURE (1)

SUMMARY: Agrarian Reform. — The work of the State Land Bank. — Construction of rural buildings. — Labour and methods of farming. — Progress in agriculture and stockraising. — The Chamber of Agriculture. — Insurance. — Price-control.

### Agrarian reform.

The ravages of the Great War and the repercussions of the Russian Revolution compelled the authorities to carry out an agrarian reform, giving land to the peasants who were without it. Further, the feudal type of agriculture, which had been firmly established in the country for several centuries, embittered the relations between the different social classes of the nation. This is comprehensible when it is realised that 800 families of the nobility owned 48.1 per cent. of the land, and that there were families owning as much as 30,000 hectares.

In Latvia, therefore, the chief aim of agrarian reform has been to provide land to those who lacked it, and so to create a new class of landowners.

The Land Office was created for this purpose; it dealt with the land belonging to the State, land bought in accordance with the agrarian law, and finally, land belonging to the Church and the communes. The original landowners are permitted by the law to retain from 50 to 100 hectares as well as industrial

---

(1) Report contributed by the Latvian Ministry of Agriculture.

enterprises established on their property; under the same law, the churches were allowed to retain possession of 50 hectares of land, and the municipalities the area essential to their needs. Legal servitudes which encumbered the land pooled in this way were abolished.

Land was distributed by the Office to small landowners who wished to increase their farms to the average area of the new farms which had been created in various parts of the country.

The maximum area of these farms was fixed at 27 hectares, but the area was varied according to the distance from industrial centres, or according to other economic circumstances.

In allotting the farms, preference was given to those who had taken part in the struggle for the liberation of Latvia. To put the newly formed farms on a sound basis, the allotments of the Land Office were calculated at a low price: for land yielding an average return, 10 lats per hectare; for land yielding a larger return, 20 lats per hectare. Those affected by this legislation were given full ownership of the land. They could therefore hand on the holding by inheritance, and could sell or lease it in accordance with the regulations of the civil code.

The agrarian law prohibited the same landowner from possessing more than 50 hectares of land. It also forbade the formation of farms of less than 10 hectares; no exception was allowed without the authorization of the Minister of Agriculture. Individuals owning several farms had to sell them within a period of three years, since legally they were only entitled to hold one.

Approximately 3,400,000 hectares of land had been assigned to the Land Office by 1 January, 1938. From 1,700,000 hectares of this area 54,154 farms, called "new properties", 1,502 gardens, 10,857 allotments for artisans and 3,007 fishermen's holdings have been created; 9,857 farms which had formerly belonged to seigneurial houses were given to farmers, who had rented them for a long period; 6,536 parcels of land were allotted to cultural organizations, 1,585 to industrial enterprises in the country, 7,347 have been incorporated in the Office for liquidating servitudes, 50,595 pieces of land have gone to increase the small farms and 11,274 areas have been reserved for other purposes. In addition, the original landowners have retained 1,306 farms and 492 industrial enterprises; 37,456 units have gone to increasing the lands of urban and rural communes.

Now that agrarian reform has been accomplished, Latvia has become a country of small farms, numbering some 276,000.

Farms whose area is less than 10 hectares (small workmen's allotments for example) amount to 44.5 per cent. of the total number of farms; those from 10 to 30 hectares, 41 per cent., from 30 to 100 hectares 14 per cent., over a hundred hectares, 0.5 per cent.

The other great task of agrarian reform, parallel to the breaking-up of large properties, has been the consolidation of holdings. Before the agrarian reform a peasant's land was composed of a large number of strips, which made cultivation difficult. Since consolidation, each farm is a continuous unit. The official surveyors have consolidated the land of 72,000 holdings in the eastern part of the country where strip cultivation was especially restrictive.

### The work of the State Land Bank.

The State Land Bank was founded in 1922 to adapt mortgage credit to the needs of the newly created farms. It commenced operations at once; in the field of agrarian reform its task has been to fix the total amount of loans for the newly created farms and the conditions for their repayment. It has also had to decide on the total amount of advances to be granted to the small proprietors owning land sold by this bank. Long-term credits were indispensable to the newly created farms because buildings had to be constructed, the soil improved, livestock hired, etc.

Besides these operations, the State Land Bank had to make long-term loans to the farmers. Agrarian reform was not confined merely to the new farms formed from the territory of the State Land Office. A more difficult task was that of modifying the distribution of land in the villages, where, following the earlier Russian system, the land belonged to the peasants by right of common ownership and was allotted to them temporarily in long strips. The holders' scattered strips had to be consolidated and re-formed into single independent farms.

The mortgage debts on the farms formed from the land of the Office represent the value of the land and buildings, in some cases the values of the forests, and finally the expenses arising from surveying. The new owners rarely pay off the amounts due in cash; more often they avail themselves of the Land Bank's credit. The mortgage debts on 83,000 farms formed from the lands of the Office have been centralised at this bank as well as the mortgage debts on 43,000 farms formed from communal land and now standing separate. The debts to the State on these farms consist of the amounts owing for the land allotted by the Land Office to increase small holdings, and the expenses arising from surveying; the latter work has been performed at the expense of the government in the majority of cases so that the newly created farms have not had to pay much. The total amount of mortgage loan is 80 million lats.

The State Land Bank has granted loans for equipping 95,000 holdings formed from the land of the Office and 45,000 farms made up from communal land. The total of these loans is 95 million lats. The Bank has also advanced 9 million lats for other types of equipment.

The amortisation period for all amounts owed to the State is fixed at 41 years. Until 1927, the rate of interest was 4 per cent, but from this date it has been 2 per cent.

To assist certain farms to pay off their long term loans the Land Bank has recently granted 11.5 million lats to 15,000 landowners; one part of this sum, 8.5 millions, has been lent at a rate of per 4 cent. and must be repaid within 28 years; the other part, 3 millions, is lent at a rate of interest of 3 per cent. and is repayable within a period of 28  $\frac{1}{2}$  years.

Altogether, the State Land Bank has advanced 195.5 million lats to farms set up as a result of the agrarian law. The total amount of loans has been reduced to 135 million lats as a result of repayments and special annual pay-

ments, as well as of subsidies granted by the State. Farms formed from the land of the Pool are mortgaged on an average at 1,400 lats; i. e. at 87 lats per hectare.

### Construction of rural buildings.

The problem of constructing farm buildings at first only affected those farms which had been newly created, those which had been ruined during the war, and finally, old holdings whose area had not exceeded 27 hectares. Farmers were able to obtain material from the State forests at a cost of a fifth of their real value for the construction of essential buildings. At the same time they were granted long-term loans by the Land Bank. To ensure that the new buildings should be comfortable and of good appearance, the Ministry of Agriculture worked out model schemes which were put at the disposal of those concerned. To encourage the use of non-inflammable building materials, a Government decree of September 9, 1926 granted landowners the cancellation of part of their debt; in this way the resources of timber have been spared. By the law of December 30, 1930, landholders could obtain non-inflammable building materials (of cement) free instead of wood.

On January 1, certain changes in the law relating to farm building came into force. By the new regulations the Ministry of Agriculture supplies non-inflammable building materials at a reduction of up to 50 per cent. of the normal price. Wood necessary for these buildings is sold at a reduction of 80 per cent. Those wishing to erect buildings in wood must buy the wood at the normal price, except for the quantity needed for non-inflammable buildings. Wood can only be obtained at half-price for barns. The non-inflammable materials supplied by the Ministry are bricks and slates. The Ministry repays farmers half the cost of transporting bricks by rail if the distance is over 50 km. The Ministry supplies sheets of insulating turf to protect the walls from cold. By the same law, the State Land Bank allows necessary loans for the construction of buildings. Those wishing to profit from these facilities have to build in conformity with model schemes worked out by the Ministry, or with private schemes approved by the Ministry. The subventions granted by the Land Bank to proprietors building with non-inflammable materials vary between 500 and 1200 lats. The subventions are paid in cash if the holding is not indebted in favour of the Land Bank. From these sums are deducted subsidies granted by the Government in supplying building materials at reduced prices.

The Latvian Chamber of Agriculture is assisting in the development of the country's prosperity. It compensates the farmers for part of the expenses to which they are subjected in irrigating and improving the hygiene of their properties.

The Ministry is authorized by special regulations to subsidize farm buildings erected on derelict land. There are 20,000 properties in Latvia ruined by the War for which the means must be found of constructing the most essential

buildings. To remedy this disaster, subsidies amounting to 5,417,277 lats have been granted by the Ministry of Agriculture.

Further, the Ministry ensures that the old war trenches are filled in and the ground levelled; in most cases this work is performed at the expense of the State. This intervention had resulted in 4,517 km. of trenches being filled in by March 1935. In removing parapets and filling in dugouts more than a million cubic metres of earth have been shifted.

On May 1, 1938, a law came in to force setting up a special fund for building working-class dwellings. This fund grants the money needed for constructing working-class dwellings and other buildings. Those having recourse to the fund for their building receive a cancellation of 50 per cent. of the loan; those not benefiting from this assistance receive a subsidy in cash. The resources of the fund are derived from half of a 1 per cent. tax on the sale of farm products, the other half being paid to the State Budget.

Between 1920 and 1930 farmers have constructed 324,432 fire-proof buildings at a cost of 573,325,394 lats; from 1930 to 1937 they built 69,195 buildings and 16,362 fire-proof buildings at a cost of 156,808,115 lats.

### Labour and methods of farming.

The social structure of Latvia's rural population has been greatly modified as a result of the agrarian reform. The number of landless peasants working as farm labourers has been considerably decreased, since many of them have become landowners; these are the "new landowners" (in Latvian *jaunsaimnieki*). As the Board gave land not only to the farm labourers but also to townspeople who had taken part in the liberation of the country, the number of landowners has been greatly increased.

#### *Number of farms classified by types, 1935:*

	Number	Per cent.
Farms cultivated by their owner . . . . .	232,978	84.51
Farms cultivated by tenant . . . . .	30,108	10.92
Farms held in métayage . . . . .	4,476	1.62
Farms lent to farm labourers as part payment of wages .	8,136	2.95
Total . . .	275,698	100.00

The owners and their families do nearly all the work themselves so that there are many holdings on which there are no wage-earners. According

to the 1935 census of farms, the number of agricultural wage-earners was as follows:—

	Number	Per cent.
Labourers engaged for the year . . . . .	48,895	33.45
Labourers engaged for the summer season . . . . .	45,986	31.45
Shepherds . . . . .	40,049	27.39
Labourers engaged by the month . . . . .	9,548	6.53
Technical Staff . . . . .	1,722	1.18
Total . . . . .	146,200	100.00

In those parts of the country where cultivation is more intensive, however, the lack of labour has been making itself felt during recent years. The working classes are attracted to the towns, where they can obtain commodities which are not to be found in the country. To check this exodus from the country, the Government has done much for the welfare of agricultural labourers. The Ministry of Agriculture has encouraged good housing by granting loans to proprietors and by supplying them with building materials at reduced prices. Labourers who have worked for one farmer for a long time are granted bonuses. Every month working-class families draw grants of from 4 to 5 lats for each child under eight years old. In the agricultural societies there are departments which attend to the spiritual and material needs of the workers. Finally, the Ministry of Agriculture assists in the purchase of agricultural implements and encourages the employment of modern methods of farming.

### Progress in agriculture and stockraising.

The farms created by the agrarian reform have attained the average standard of agricultural development. Less conservative than the old landowners, the new farmers have frequently shown much more interest in the employment of modern methods of farming.

Very satisfactory crops have been obtained as a result of raising the standard of intelligence and through the technical assistance of the Government.

#### *Average yield in quintals per hectare.*

	1909-13	1920-24	1934-37	1937
Winter Rye . . . . .	9.3	8.6	13.7	14.7
Winter Wheat . . . . .	12.4	10.6	14.6	13.7
Summer Wheat . . . . .	8.2	8.9	11.0	11.3
Barley . . . . .	9.1	8.3	10.8	12.0
Oats . . . . .	9.1	8.2	11.2	12.1
Potatoes. . . . .	80.3	90.1	131.8	140.2

Like agriculture, stockraising is now giving very satisfactory results and is the peasants' most important source of revenue. The number of farm animals has increased very considerably. In 1937 the number of horses had increased by 7.5 per cent. on the years 1925-34; the number of cattle by 16.5; that of pigs by 32.99 per cent. and that of sheep by 26.33 per cent. Similarly, the production of milk has greatly increased. While in 1927-28 a cow gave an average of 1680 kg of milk per annum, in 1936-37 it yielded 2290 kg.

As agriculture is the form of production best suited to the country, the Government has subsidised all branches of the rural economy, i. e. cultivation of cereals, stockraising, etc.

More than a third of Latvia suffers from excessive humidity, so that the Government and the farmers attach very great importance to the work of improving the soil. Now that the level of certain rivers and lakes has been lowered, it has been possible to start draining the fields and meadows. The farmers have formed Land Improvement Societies for digging the main drains; in 1938 there were 2300 such societies, with a membership of 70,000. The Government placed its technical staff at the service of these societies, while at the same time it is responsible for from 50 to 90 per cent. of the cost of the work. The Land Bank has granted long-term loans (28 years) towards helping the farmers to carry out the improvement of their land. From 1921 to 1937 the length of rivers deepened and drains dug was 20,750 km. The work has cost the Government 30 million lats and has enabled nearly 515,000 hectares of land to be drained. The farmers have at their service special bureaux which prepare improvement schemes. At a small charge, the Government hires out tractors and other agricultural instruments to the farmers for clearing the land; similarly, they pay 50 per cent. of the cost of transporting the drainage pipes.

### **The Chamber of Agriculture.**

Up till 1935 farmers were grouped in several central organisations aiming at the development of agriculture. From this date a special law assigned the task to the Chamber of Agriculture. The Chamber consists of 120 members representing the farmers of whom 100 are nominated by the Minister of Agriculture, selected from lists of candidates drawn up by the agricultural associations; the other 20 are chosen from a list of candidates proposed by the chairman of the Chamber. The latter are chosen from the élite of the farming world; the Dean of the Faculty of Agricultural Science of the University of Latvia is a permanent member. The business of the Chamber is conducted by the President, the Council, and the General Assembly. The President and Vice-Presidents, five in number, are nominated by the Minister of Agriculture. These 6 persons together with a representative of the Minister of Agriculture form the Executive Committee of the Chamber.

The work of the Executive Committee is distributed between 15 departments:— (1) administration; (2) societies of agricultural economy; (3) agricul-

ture; (4) zootechnical; (5) economic; (6) labour; (7) cooperation; (8) instruction; (9) horticulture; (10) bee-keeping; (11) building; (12) technique and rural housing hygiene; (13) land improvement; (14) domestic economy; (15) pisciculture. This enumeration of the departments gives a general idea of the work of the Chamber.

The Chamber itself comprises 15 departments corresponding to those of the executive committee.

The General Committee of the Chamber coordinates the activities of the organizations formed for carrying out the work planned in the Departments and approved by the Executive Committee; it investigates problems affecting the development of agriculture, decides measures to be taken and checks the financial statement of the chamber before placing it before the general assembly. The President, the Members of the Executive Committee, and the Heads of Departments take part in drawing up the financial statement.

The funds of the chamber consist of (1) revenue from its own property; (2) payments for services rendered; (3) allocations from the State; (4) donations and unforeseen payments. In the financial year 1938-39, the Chamber's budget amounted to 3,517,283 lats. The Chamber possesses a considerable number of agricultural scientists and maintains several schools and experimental stations. It assists farmers to cooperate and encourages anything that may be conducive to the development of the different branches of agriculture.

### Insurance.

There is a special assistance fund, whose activity is regulated by law, to assist farmers suffering from losses caused by hail, flooding or storms. The Ministry of Agriculture ascertains the losses suffered and fixes compensation in proportion to the damage.

The funds for this are obtained from (1) farmers' contributions; (2) Government subsidies; (3) donations. The farmers' contributions are very small, being about 0.05 per cent. of the value of the property.

In the same way, farmers are compensated for buildings, fruit-trees and fields which have sustained damage, if this damage does not amount to more than 25 per cent. of the value of the property. If the farmers' contributions are insufficient to compensate for the losses, the State makes up the difference.

In each commune there is a mutual fire insurance society with which farmers have to insure all their buildings. These societies also insure crops and livestock. All these societies belong to a central society by which they are reinsured for the most serious risks.

### Price-control.

The control of the prices of farm products was begun in 1934 by the authoritarian government of the President, Dr. K. Ulmanis. Official institutions, the provincial cooperators and the central farmers organizations have been

called upon to collaborate in controlling the markets for agricultural products. These markets are authorised to buy the chief agricultural products at a price fixed by the Government and to sell them to consumers or to export them. This policy, which tends to keep prices stable throughout the country, influences private enterprise by forcing it to adapt its prices to those fixed by the Government. When the buying price is higher than the selling price, the difference is paid to the central organization by the Government. In fixing the prices for all the principal farm products the Government leaves a margin between the sale-price and the cost of production so that a normal return accrues to the farmer.

## **INTERNATIONAL CHRONICLE OF AGRICULTURE**

### **NETHERLANDS**

In the Netherlands small- or medium-sized farms account for most of the agricultural production, and from the point of view of employment of labour, farming is very intensive. Horticulture is also of very great importance. Such a distribution of farms, together with the large supplies of capital seeking investment, was bound to result in a highly developed specialization. On the other hand, this highly intensive farming made it impossible to obtain within the country all the raw materials required for animal production. For this reason, side by side with a large output of commodities obtained by a great outlay of capital and labour (butter, cheese, bacon, eggs, vegetables, fruit, flowers, flower-bulbs, etc.) there is a very large import of stock feeds. The reduced purchasing power from 1929 onwards curtailed trade in luxury products; later, the policy of import restrictions adopted by nearly all countries had even more unfavourable results. The position of Netherlands agriculture and horticulture during the crisis was thus one of extreme difficulty, and to meet it the Government was obliged to take special measures.

The following table gives some index-numbers which show the trend of prices paid to farmers for their principal products (average of prices from 1924-25 to 1928-29 = 100).

Products	1934-35	1935-36	1936-37	1937-38
Wheat. . . . .	77	70	68	69
Rye . . . . .	65	63	75	64
Barley. . . . .	73	64	71	63
Oats . . . . .	60	59	69	59
Potatoes . . . . .	73	53	60	72
Beef . . . . .	54	47	61	72
Pigmeat . . . . .	44	50	57	75
Butter. . . . .	51	55	58	63
Cheese. . . . .	44	47	48	55
Fresh milk. . . . .	60	64	67	75
Eggs . . . . .	41	43	49	55

The prices of animal products, especially in the later years, were relatively lower than those of the production requisites. This has actually been the Government's aim. There is already an overabundance of animal products and a favourable relationship between cost of production and prices obtained by farmers (allowing for taxes and subsidies) would result in another large increase in production. But the situation is not as unfavourable as the figures might suggest because considerable technical progress has been made in recent years.

With the beginning of 1938, the situation changed however; cereal prices on the international markets again fell, while those of animal products remained at the comparatively favourable level reached in 1937. Prices within the country followed the same trend but much less markedly: by means of import levies and subsidies to production, the level of the end of 1937 was on the whole successfully maintained.

The improvement in the situation in recent years is shown by the data from farm accounting for farms in certain areas representative of the country's agriculture:—

Area	Gross return	Farm expenses (1)	Difference
	(Florins per hectare)		
Grazing land districts, clay soil — Friesland:			
1935-36 . . . . .	268	144	124
1936-37 . . . . .	314	163	151
1937-38 . . . . .	353	182	171
Arable land districts clay soil — Friesland:			
1935-36 . . . . .	298	186	112
1936-37 . . . . .	370	211	159
1937-38 . . . . .	395	233	162
Sandy soil districts — Overijssel:			
1935-36 . . . . .	246	183	163
1936-37 . . . . .	308	206	102
1937-38 . . . . .	336	213	118
Delf and Schie areas in South Holland:			
1935-35 . . . . .	408	284	124
1936-37 . . . . .	470	312	158
1937-38 . . . . .	503	349	154

(1) Including estimated wages to adult children of the family working on the farm, but excluding estimated wage claims of farmers and taxes.

### General tendencies of agricultural policy.

The policy of the Government has thus been as follows: An attempt was made to encourage the growing of cereals likely to find a market within the country (where prices might be influenced), at the expense of the crops grown for export. Wherever possible and desirable, the production of the export crops was reduced so as to limit the supply to the requirements of the home market. This limitation was not practicable for other products; in this case prices within the country were successfully raised by means of somewhat complicated method, and an average price, remunerative or nearly so, was secured for all production. This policy was carried out by

means of special organizations, set up for the purpose in accordance with the laws on the agricultural crisis (1). These organizations exercise some control over production, imports and exports, and even, in many cases, over consumption. They collect levies on certain products and pay out subsidies and rebates on others.

During the first years of the crisis the purpose of the measures taken was merely to protect certain branches of national economy against serious losses. The law of 1933 conferred more freedom of action on the Government, but still embodied the idea of assistance over a period of crisis. It was only later that the idea of a general definitive regulation began to make headway.

In the second half of 1936, when most countries seemed to have emerged from the crisis and when, on September 28 of that year, the Netherlands were obliged to abandon the gold standard, the foreign prices of agricultural products, expressed in Netherlands currency, rose very considerably. At this moment it became possible to simplify the intervention policy and at the same time to make it more permanent. This modification is still in process. The methods of assistance given to agriculture have varied in detail according to the nature of the various products. Experiments were made which it was often necessary to modify later. In the following survey only brief references will be made to these discorded measures. To avoid repetitions, it may be stated here that, speaking generally, the importation of the various agricultural products is placed under a monopoly or at least under a quota system, so as to protect the home market against foreign products. Moreover, monopoly taxes serve the twofold purpose of raising home prices and of financing the assistance given to agriculture.

For the export of Netherlands products compensation is often given to the producer for the increase in home market prices consequent on the measures relating to imports.

### Wheat market.

The price of home-grown bread wheat is fixed before the sowings. It is a remunerative price, very favourable in comparison with the prices of most other products. Farmers consequently endeavour to grow as much wheat as possible, and hence the Government has had to intervene to limit the sowings (except for the smallest farms) to one third of the arable area. At the end of 1936 the limitation was abolished. From 1925 to 1929 the average area under wheat was 54,800 ha., in 1936 the area was 151,200 ha. This home-grown wheat is bought by a special organization, membership of which is compulsory on the farmer and from which he may be expelled in the event of serious infringement of the rules prescribed, for example, for malpractices in connection with delivery. This organization delivers the quantities required for bread-making to another organization which, with certain exceptions, mixes the home-grown wheat with imported wheat—35 per cent. of the wheat milled for bread-flour must be home-grown—and delivers it to the mills. The flour produced from this mixture is sold to the bakers at a fixed price. Wheat, wheat flour and other cereals and cereal products, as well as pulses may be imported only through a monopoly organisation which imposes on the importers a levy known as "Difference between the monopoly's purchasing and selling price".

---

(1) Laws of May 5 and of August 5, 1933 (*Staatsbladen* No. 261 and 418). For a French translation, see the *Annuaire international de législation agricole*, 1933, p. 475 and p. 484.

### Secondary cereals market.

For rye, barley, and oats, the subsidy measures result in prices relatively lower than those of wheat; this is reasonable in view of the fact that these cereals are mainly used as stock-feed and that it is essential to keep prices of livestock products as low as possible. Moreover, the bulk of these cereals and especially rye, grown mainly on the small farms of the sandy districts, is consumed by the animals on the farm itself. Measures in favour of these cereals are thus limited to: (a) a monopoly tax on imports; (b) a subsidy on barley production (threshed on the farm, under the supervision of an inspector of the Agricultural Crisis Service); (c) a denaturation bonus on imported rye, the object of which is rather to reduce the price of fodder rye—before the crisis, the Netherlands were among the largest importers of rye.

As soon as cereal prices rose, import levies were reduced and the two other methods of intervention were abolished. In 1938 levies were again increased on several occasions and in September the denaturation bonus on rye was reintroduced. Further in October and November 1938 the Central Arable-farming Organisation bought at a price higher than the market price, and temporarily stored, certain quantities of barley.

Results of the interventions have varied: the area under rye, which is grown mainly in the sandy districts and in the Fen Colonies, has further increased, although wheat-growing has been introduced into these regions; barley, within certain limits and on certain lands, is a remunerative crop and there has been an extension of its cultivation. In the case of barley a special and favorable factor was the introduction of malting barley, formerly very little cultivated in the Netherlands. Cultivation of oats, on which the import levy is lower than on the other cereals has somewhat decreased.

### Pulses in shell market.

Normal prices have been fixed by the Government for peas, kidney beans and broad beans. In face of actual prices which, supported by a monopoly's import levy, had already before the 1936 harvest exceeded the established normal prices, the import levy only was maintained and a denaturation bonus for peas assigned, with the object of withdrawing from the home market a proportion of the surplus which was causing congestion. In 1936 a threshing bonus was introduced for beans similar to that given for barley. In 1937 this bonus was abolished and replaced by a denaturation bonus similar to that given for peas.

### Flax market.

Flax fibre is an export product and for several years its price was much below costs of production. Encouragement was however given by the Government to this crop; in the first place it requires much labour (including processing during the winter), thus reducing rural unemployment, and, although this is a secondary consideration, it is very useful in the rotation. Bonuses were calculated up to 1936 for a maximum area of 15,000 ha., in 1937 the calculation was for 18,400 ha.: payment is made per harvested hectare. There is a processing bonus as well as a cultivation bonus.

### Potatoes market.

After several attempts at subsidising, a cultivation fee was finally imposed in 1935 on potatoes grown for consumption with restriction of the area on which cultivation is allowed. The levy is used to pay denaturation compensation for quantities which cannot be sold for consumption.

Since 1930 the situation had become serious in regard to potatoes grown for potato starch, one of the main products of the Fen Colonies. After several attempts to improve the position of stocks, an export monopoly was adopted for the season of 1934-35. Since then, factories have obtained a remunerative price for their output and can now pay 1.30 florin per quintal for potatoes. Potato-growing is allowed only within certain limits, fixed in relation to the total quantities which it is considered can be utilized and to the character of each farm.

### Sugar-beet market.

This product was among the first to be subsidized. Beginning with the 1931 crop, and for a certain percentage of the quantities delivered to the refineries during the three years 1928-30, a minimum price was guaranteed, based on the average price of sugar. In 1936 the quota for each farm was reduced, a supplementary quota being allowed in certain regions and to farms which owing to their special character are dependent on sugar-beet production.

### Horticulture.

Certain limits have been placed on the area of vegetables in the open or under glass, of flower bulbs, of flowers, of fruit and small fruit, and of nurseries. Cultivation for the market beyond such limits is an infringement involving penalties. With some exceptions, all products for sale must be sold by auction. Vegetables which cannot be sold at a given price are distributed to needy persons, bottled or even destroyed, and the growers receive compensation. Prices of orchard and small fruits grown in the open or under glass have usually been high enough to make intervention unnecessary, except of course quota-fixing of the imports and the import levy. The fruit juice industry, which absorbs considerable quantities of fruit of inferior quality, is making steady progress; the demand on the part of the public has increased considerably in recent years. For flower bulbs, in addition to the restriction of areas and the principle of minimum prices, it has been made obligatory to consign certain hyacinth bulbs to an organization which purchases and destroys the unsaleable surplus; export is controlled. Although the financial results of these types of cultivation are still far from satisfactory, a considerable advance has been achieved as compared with the worst years of the crisis.

The Netherlands are large exporters of flowers and there is always a large demand within the country itself; there is however an excess import of ornamental plants. The position for growers of cut flowers still remains unsatisfactory; it has been necessary to destroy large quantities of flowers which found no buyers at auction sales. Measures taken in favour of nurseries do not greatly differ from those relating to other branches of horticulture. Mention may be made also of the credits accorded to horticulture. There is a gradual but slow improvement in the economic situation.

## Stock-raising.

*Cattle- and pig-breeding* are of very great importance in the Netherlands. In 1937 permanent grasslands constituted 55 per cent. of the agricultural area. The relatively higher prices of crop products have had only a slight influence on the transformation of grasslands into arable lands; owing to the soil structure, the greater part of the grassland, although forming excellent meadow land, is not very suitable for ploughing. The cattle grazed are mainly dairy herds; meat is rather a by-product. The milk not consumed in a liquid state is converted into butter, cheese, condensed milk and milk powder. The skimmed milk, buttermilk and whey of which there are considerable quantities, are used to fatten calves and especially pigs.

With a view to limiting animal production, breeding of calves and pigs has been made conditional on the issue of special permits. The effects of this measure can only be slow so far as cattle-breeding is concerned; farmers still have very large numbers of calves. As the old cows are replaced by young cows, the farmers take the opportunity to improve the quality of their stock. In this connection it is significant that 13 per cent. of the dairy cows were put under yield tests in special associations in 1937, and the total milk production is on the increase from year to year. Measures affecting prices are concerned mainly with taxes on consumption within the country and with export premiums. The result of these is an average price, paid to the producer, which is barely remunerative. An export monopoly was instituted at the end of 1936: only exporters belonging to the crisis organization set up for dairy products are entitled to export specified dairy products to countries specially designated. There was already in existence an import monopoly both for dairy products, imports of which are of very little importance, and for beef. The consumption tax on meat, the proceeds of which were devoted to the crisis funds was abolished at the end of 1937.

There has been a more effective limitation of pig numbers. Here also the price policy has been of great importance. Although the pork butchers retain the right to buy pigs for slaughter, the purchases of the central organization for carrying out crisis measures in regard to pigs outweigh all others. This body pays prices varying with the quality. Moreover, the central organization, during certain periods, purchased only bacon pigs, that is, pigs weighing less than 60 kg. As a result of these measures, there was a decline in the total numbers of pigs, from 2,082,000 in May 1934 to 1,406,000 in 1937, while the numbers of pigs weighing over 60 kg. fell from 735,000 to 372,000 in the same period. Subsequently, owing to the improved situation, there has been an increase: in May 1938, the figures were respectively 1,538,000 and 388,000. From 1930 to 1937, the number of members on the Herdbooks for pig-breeding rose from 2,230 to 12,865, the number of boars awarded premiums for quality increased during the same period from 470 to 1,788, and the percentage of sows served by boars registered in the Herdbooks rose from 13 to 71 per cent.

An existing tax on pigmeat was abolished at the end of 1936.

There has been an increasing interest in *horse-breeding*, and the number of mares served rose from 44,700 in 1934 to 60,900 in 1937.

*Sheep-breeding* is of no great importance. The interest in *goat-breeding* is to be attributed mainly to the constant need existing among large groups of the population to reduce cash expenditure as far as possible.

*The poultry industry*, which at the beginning of the century was so little developed that the Netherlands was a large importer of eggs, has since then shown a steady increase. It attained very great importance in particular after the world war and now the country stands second on the list of egg-exporting countries.

Poultry-keeping is partly carried on on specialized holdings but mainly on farms where it is a very useful side-line, this being the case particularly of small farms in sandy districts. For this reason and also because poultry-raising requires a great deal of labour, it is not practicable to reduce production to any great extent, although prices on foreign markets are not at all satisfactory. The object of the measures taken is thus rather to prevent increase in total production while increasing the yield per hen. In the first place, hatchings in incubators beyond a certain quantity and for longer than a certain period are prohibited. Even on the small farms, chicks used for breeding purposes are bought mainly from specialized breeding farms. As a result of the restriction of the hatching season to a period ending at the beginning of May, the young hens are already full-grown and strong at the beginning of winter. A regulation encouraging the purchase by the hatching farms of eggs from breeders with a reputation for the quality of their birds has still further influenced the quality of the poultry.

Exports of eggs and poultry at the prices ruling on the English market cannot be remunerative, largely because of the relatively high prices of poultry feeds. To balance these prices, rebates are given on exports; these are too low to be regarded as actual premiums.

### Special measures for small farms.

All the measures mentioned above aim at making certain types of arable farming and stock-raising reasonably remunerative. But they mainly affect large and average sized farms, so that the small farms have gained relatively little benefit from them. To deal with these a special organisation has been set up.

The small farm plays a very important rôle in Dutch agriculture. It makes it possible for a farm labourer to achieve independence. As a result agricultural areas where there are adequate possibilities of forming such farms, especially sandy areas, are less depopulated than others. In addition small proprietors make excellent citizens and help greatly in the accumulation of new capital, since they are keen, they have a sense of responsibility and they are eager to save. To encourage the growth of this class a law was passed in 1918 assisting agricultural labourers to obtain a dwelling and a piece of land. With the same object, facilities were given in 1919 for forming small farms on land which had been newly broken up. In 1934 it was decided to found a special bureau for small farms. This bureau made a thorough investigation before deciding on the methods to be employed. As a result of this investigation, small farmers were divided into three groups:— (a) those working regularly for other farmers; (b) those working chiefly on their own land who, as it does not use all their time, seek occasional work on larger farms, the return on their own land being too small for them to live on; (c) those whose whole time is spent on their own farms, too small for subsistence in bad seasons.

Action regarding group (a) is a problem of unemployment and is therefore dealt with by the Ministry of Social Affairs. Action in relation to group (c) is concerned with the yield of the farm and is decided by the Ministry of Economic Affairs. Problems affecting group (b) are dealt with by these two Ministries together. The ordinary scheme for unemployment assistance covers the needs of the first group. These workers, like those owning no land at all, receive a regular payment throughout periods of unemployment. In addition, an attempt is made to employ them in the public utility works which have been started of late years to reduce unemployment. The work on behalf of groups (b) and (c) has been centralised at the Bureau

for Small Farms, which began taking direct action on November 1, 1937. Each small farmer receives personally advice and information from assistants on the staff of agricultural advisors. Each assistant looks after the interests of a very small number of farms. So long as they follow the advice given, the farmers in group (b) receive a payment in cash each week, while those in group (c) receive tickets for obtaining farm equipment at very reduced prices or sometimes even free. The cash payment varies directly with the return from the farm and inversely with the size of family. The tickets are given after the responsible assistant of the Bureau has calculated the need for chemical manure or of food for livestock; or where he is convinced that the farm needs certain machines or tools. The object of these tickets is not so much to obtain equipment for the farms but rather to enable the farms to follow the advice given.

After one year's operation, great progress can already be recorded and it is expected that certain improvements may serve as models even for the larger farms.

### Drainage of a part of the Zuyderzee.

The formation of the north western polder, the Wieringermeerpolder, and the construction of the dyke which separates the southern part from the open sea, were finished several years ago. In the polder, the digging of canals and the laying out of roads are continued, as also the improvement of the soil and the erection of farm buildings and of buildings for public services, etc. All this is effected at the expense of the State; farm holdings are then rented off where after several years of cultivation the structure of the soil and the low percentage of sea salt reached makes it possible to expect satisfactory yields. In 1938 the area worked by the special organization founded by the State for the land improvement was 7,609 hectares, there are besides 8,647 ha, forming 214 fully equipped farms with buildings and 1,113 parcels rented without buildings, and 631 hectares were taken up by plantations of young trees, villages, etc. Lands intended for buildings other than farm buildings are leased on terms of emphyteusis. The land-rent is fixed on the basis of the index-numbers of prices of agricultural products, calculated by the Bureau of Agriculture, separately for arable and for grazing lands. On November 1, 1938 a further 54 farms of a total area of 1,915 ha. were rented.

The new polder is not yet divided into communes, but is administered by a public body of a form which is new to Dutch law (1); this corporate body, *De Wieringermeer*, is made responsible for the improvement of the lands for agriculture, and for the construction of dwelling houses and roads; this body has the administration of the State properties and is entitled to farm up to a maximum of 1,000 hectares on account of the State; it has to administer all interests relating to the water-ways or water supplies within, and, for certain purposes, outside the polder; and finally to take all measures which are ordinarily within the competence of the communes.

The construction of the dyke for the second polder situated at the north east of the lake is going forward. This polder will have the advantage of the immense experience gained from the Wieringermeer; in addition the reclaimed land will from the outset have a much reduced percentage of sea salt, as it is now covered by the fresh water of the Yssel Lake, whereas the dykes of the first polder were finished before the closing of the great dyke which formed the new lake.

---

(1) Law of May 31, 1937, *Staatsblad* No. 521.

### Law on tenancies.

The law on rural leases was revised by a Law of May 31, 1937 (1). Up to this time they had been regulated by the Civil Code introduced into the Netherlands in 1838 and based on the Napoleonic Code. The new law contains a number of stringent provisions. The length of the lease, except in rare cases, is not fixed; the contract cannot be dissolved till after ten years and only at one and a half years' notice. Both landlord and tenant have quite definite obligations. The landlord is required to deliver to the competent magistrate a signed copy of the lease. If the magistrate considers that the rent is too high to ensure a reasonable standard of living for the tenant and if he does not succeed in obtaining the consent of both parties to a reduction, he can annul the lease. If the landlord has not delivered the required copy within the stated period, the terms will be presumed to be in agreement with the current usages for farms or lands of similar character, except as regards provisions which may be more favourable for the tenant. The landlord is bound, for the duration of the lease, to undertake all the repairs necessary, other than the small upkeep repairs which are the duty of the tenant; if he omits to fulfil this obligation after written notification from the tenant, the latter has the right to carry out the repairs himself at the expense of the landlord. As a rule, the landlord is bound to pay to the tenant, on the expiration of the lease, fair compensation for improvements made by him. Under certain conditions, the tenancy may be modified during the duration of the lease, in favour of one or the other party.

In the event of notice to quit being given by the landlord, the tenant may apply to the court for annulment of the notice; the magistrate will refuse such application only under certain conditions. Compensation may also be granted. Special courts have been set up for hearing these cases. These are the cantonal tenancy commissions of the canton court of justice, consisting of the canton magistrate as president and two experts. In addition organizations having legal personality have been instituted with the object of promoting good relations in respect of rural leases. These bodies, the recognized Tenancy Offices, will have the right to approve leases and when thus approved, there will be no obligation on the landlord to deliver a copy to the magistrate. These Offices will also give advice on tenancy questions and will draw up standard contracts. The law came into force on November 1, 1938.

### Law on agricultural exports.

The new Law of February 4, 1938 on the export of agricultural products (2) replaces the law of 1929. The former law had regulated exports of butter, cheese and bacon and had empowered the Government to regulate exports of other products by means of regulations of public administration to be ratified afterwards by law. The law of 1938 regulates exports of 53 agricultural and horticultural products and provides that not only the products themselves but also their packing shall be subject to criteria of quality. Control at the time of export may be in the hands of private institutions having legal personality. The new law does not so much introduce fresh regulations as confirm and extend the action already taken by private initiative or by the agricultural crisis legislation.

### Law on consolidation of holdings.

The new law on consolidation of holdings (1) greatly facilitates the procedure. Under the law of 1924 the application for consolidation had to be signed by at least one fourth of the landowners; now, it is enough if one fifth sign; the initiative in the matter is also conferred on agricultural associations and on certain bodies having legal personality. Under the former law, the scheme had to be approved by a majority of owners who were also owners of more than one half of the lands; now it is required only that one of these two conditions shall be fulfilled.

## UNITED KINGDOM

In the summer of 1937 industrial prices began to fall while agricultural prices continued to rise; at the beginning of 1938 both industrial and agricultural prices were falling; now, in the second half of 1938 industrial prices have been steady while agricultural prices have continued to fall rapidly.

The check to the fall of industrial prices suggests that the deterioration of the general economic situation in the United Kingdom, which has been going on since the summer of 1937 is being halted. The rapid increase in the number of unemployed—from 1,413,000 in 1937 to 1,708,000 in the first quarter of 1938—has ceased; the figure for the third quarter of 1938 was 1,716,000. The index of industrial production prepared by the Board of Trade has however continued to fall. There is as yet little evidence of increased prosperity likely to have a favourable effect on the agricultural situation. The level of money wages remains steady and the number of persons employed has fallen slightly in recent months.

The index of the level of prices of agricultural produce fell from 90 in June to 82 in November (2), this latter figure being the lowest since September 1936. The prices of cereals and farm crops have fallen more sharply than have the prices of livestock and livestock products. The greatest individual changes shown in the index have been the fall in barley price index from 120 in January to 68 in November and in wheat prices from 83 in January to 44 in November. The index of sheep prices fell from 82 in January to 67 in November; fat cattle prices have changed much less, the index being 89 in January and 80 in November.

The fall in barley prices must be in part attributed to the heavy home-harvest; the estimated total produce in 1938 was over 933,000 long tons, that in 1937 was 705,000 and the average for the years 1927-36, 867,000 long tons. Sheep prices have fallen much more heavily than is warranted by any apparent change in the supply position; home marketings of sheep and imports of mutton and lamb were not much different from the average. Some explanation of the fall may be found in the bad situation of the skin and wool trades adversely affected by world conditions.

Agricultural imports in the first nine months of 1938 valued £ 305 million, to be compared with £ 294 million for the first nine months of 1937 (3). The quantities

(2) Base, 1927-29 = 100; corrected for seasonal variations.

(3) Figures for "Food and Drink."

imported were at about or below the average except in the case of barley and of cereal bye-products both of which were considerably larger. The average for the years 1933-37 of barley imports during the first nine months of the year was 541,000 tons; during January-September 1938 727,000 tons were imported. Wheat imports were also slightly above the average.

Meat imports were about the average weight. Mutton and lamb imports during January-September 1938 weighed 272,000 tons, the average for the same period for the years 1933-37 was 268,000 tons.

The fall in the prices of agricultural produce has been in some part offset by a decrease in the cost of fertilizers and feeding stuffs. The Ministry of Agriculture's Index (base, corresponding months 1911-13 = 100) of the prices of feeding stuffs fell from 127 in January to 117 in June and to 97 in November; fertilizers prices which had remained steady during the first half of the year at 94 fell to 93 in October and November.

Protection against the effect of falling prices is now afforded the United Kingdom farmer by various Government price guarantees and other assistance. This protection is however given only in respect of certain products and is less close for one product than for another. Thus at this time when prices of both wheat and barley have fallen heavily the position of the wheat-grower, who is guaranteed a minimum price of 10s. per cwt. for his produce—the present market price is less than half of this—is contrasted with that of the barley-grower, who, although entitled to a subsidy when the market price falls below 8s. per cwt., is not guaranteed a minimum price as his subsidy is less than equivalent to the price deficiency. The producer of fat cattle is entitled to a subsidy and his market is protected by quantitative import regulations closely related to the market situation; the sheep-farmer, on the other hand, has no subsidy and his market has been less closely protected by import regulations.

The weakness of the markets for sheep and barley is all the more serious as these two products are the main products of many farms on the light soil of eastern England. The farmers appealed to the Government for assistance, and in December 1938 the Minister of Agriculture announced measures of assistance for them. The barley subsidy is to be increased and the imports of mutton and lamb are to be closely regulated. These measures did not satisfy the farmers.

At the same time a Milk Bill introduced to extend and consolidate with important amendements, existing measures, was withdrawn by reason of strong objections, particularly from the English Milk Marketing Board (1).

In view of these difficulties the Government decided to reconsider its agricultural policy as a whole; and the new measures planned for milk, wheat, and poultry are being held in suspense for the present.

### Trade agreement with the United States.

This agreement, signed in November 1938, highly important for the general economic situation, has but small direct effect on the position of the United Kingdom farmer. By the agreement the United States undertakes to lower import duties on a wide range of goods, mainly industrial, and the United Kingdom, to lower

---

(1) A description of this Bill and an account of the conditions and prices for the milk market for the contract year 1938-39 will be given in a subsequent number of this *Chronicle*.

duties on industrial goods, raw materials and food products. The main agricultural imports into the United Kingdom which are affected are wheat, maize, pig products and fruit. The 2s. per quarter import duty on wheat is removed; the United Kingdom farmer is protected against the effects of this change by the provisions of the Wheat Act, 1932 (1). Maize imports are to be free of duty till the end of December 1941; they were, however, previously free of duty till the end of December 1939 in accordance with the existing Anglo-Argentine agreement. Duty free entry of hams is to be continued and the United States' quota increased (2), and at the same time the 10 per cent. duty on lard is to be removed; the pig-breeder is protected against the effect of an increase of ham imports by the provisions of the Bacon Industry Act, 1938 (3) and a new measure has been introduced to adjust the position to the change in the condition of lard import (4). The duties on apples and pears are to be reduced; the new rate has, however, an incidence of over 15 per cent. ad valorem, and the United States has undertaken to call the attention of American exporters to the desirability of co-operating with the Empire Fruit Councils set up to plan shipments so as to avoid excessive fluctuations of supply and prices.

Of advantage to the United Kingdom farmer is the reduction of the duty on agricultural tractors imported into the United Kingdom.

### Import regulations.

*Mutton and Lamb.* — Imports of mutton and lamb into the United Kingdom were first quantitatively regulated in accordance with the Ottawa Agreements Act of 1932; this provided for the limitation of supplies from foreign countries to given maximum quantities fixed from time to time as a percentage of those imported in corresponding quarters of the Ottawa Year. Further, since 1935 imports from British Empire countries have been regulated by agreements made from time to time between the United Kingdom and Australia and New Zealand, the two main Empire suppliers.

Now, in view of the bad position of the sheep-farmer in the United Kingdom, the Minister of Agriculture has, after consultations with the Australian and New Zealand Governments, decided that in future imports into the United Kingdom shall be regulated in the following way. Supplies from the Empire countries shall be regulated by the Empire Beef Council whose functions are to be correspondingly enlarged. This Council was set up in 1937 to consider Empire aspects of beef supplies to the United Kingdom and works in association with the International Beef Conference (5). The Council is to consider the mutton and lamb supply position as a whole (6). At the same time the Government itself is to regulate imports from foreign countries. For this purpose an order has been made providing that live sheep, mutton and lamb shall be imported into the United Kingdom only under licence (7).

(4) See p. 44.

(5) See the April 1938 number of this *Chronicle*, p. 214.

(6) In this connection was made the Ottawa Agreements (Importation of Wheat) Amendment Order, 1939 (S. R. and O. 1939. No. 5).

(7) Sheep, Mutton and Lamb (Import Regulation) Order, 1939 (S. R. and O. 1939 No. 4).

## Home market regulations.

*Wheat Levy and Subsidy.* — The wheat-grower is guaranteed, by the provisions of the Wheat Act, 1932, a price of 10s. per cwt. He is entitled to receive from the Wheat Commission a subsidy to make good any deficiency in his returns due to the market price being lower than this; funds for this purpose are obtained by the Commission from a levy—"quota payments"—imposed on millers and importers of flour. In the year 1937-38 the market price received for wheat was officially ascertained to be slightly less than 8s. 5d. per cwt. At the end of 1938 the price had fallen to less than 4s. 5d. per cwt. In view of this the Wheat Commission has increased the quota payments due to it.

The good prices obtained for wheat at the beginning of 1937 had allowed the suspension of the payments, for the first time since the beginning of the scheme. In September 1937 they were reimposed at the rate of 2.4d. per cwt., and the rate has since been continually and rapidly increased (1) till at present it is 28.8d. per cwt. the highest rate ever fixed.

At the same time the maximum amount of wheat on which the Commission will pay a subsidy has been raised. For the season 1937-38 the amount was 25,000,000 cwt.; for the present season, 1938-39, the amount was first fixed at 30,500,000 cwt. but has now been raised to 33,000,000 cwt. (2). This latter figure is also the highest since the beginning of the system.

*Oats and Barley Subsidy.* — By the Agriculture Act, 1937, the grower of oats or barley was given the right to receive from the Government whenever the price of oats fell below 8s. a hundredweight, a subsidy equal to six times the deficiency in price or £1 per acre, whichever is less. This subsidy is payable not on each hundredweight sold but on each acre under oats or barley; and as the yield of oats and barley is about 14-16 hundredweights per acre the subsidy does not fully compensate the grower for the deficiency in price. Moreover the subsidy is based on the price of oats and is independent of the barley price.

Thus the barley-grower had less protection from the heavy fall in prices that has occurred in recent months, than had the wheat-grower.

Moreover a farmer could not receive both a deficiency payment under the Wheat Act and also a subsidy on his barley and oats acreage. Therefore, as many barley-growers also grow wheat on a large scale, many receive no subsidy at all on their barley acreage.

To assist further those farmers whose main corn crop is barley the Government propose to invite Parliament to increase the subsidy payable this year, from the 10s.

---

(1) See previous numbers of this *Chronicle*. Wheat (Quota Payment) No. 5 Order 1938, which came into force on October 16, 1938 fixed the rate at 24d. per cwt.; No. 6 Order 1938 fixing the rate at 28.8d. per cwt. came into force on November 13, 1938.

(2) Wheat (Anticipated Supply) No. 2 Order 1938 fixed the amount at 30,500,000 cwts; No. 3 Order 1938 raised it to 31,850,000 cwts.; and No. 4 Order, made in November raised it further to 33,000,000 cwts. The maximum amount on which a subsidy may be paid is fixed by the Wheat Act, 1932, as amended, at 36,000,000 cwt. See in this connection the *Chronicle* for January 1938, p. 58.

per acre, which, it is estimated, would be payable under present arrangements and conditions, to £1 an acre. This is regarded as an emergency measure.

The barley-grower had previously, and still retains, a further measure of protection in the undertaking given by the Brewers Society in 1936 to purchase each year a minimum quantity of 7,500,000 cwt. of home-grown barley and to increase their purchases *pari passu* with any increase in the production of beer over that in the year ending September 30, 1935. In the year 1934-35 the brewers purchased 7,458,000 cwt., in 1935-36, 7,729,000, in 1936-37, 8,189,000 and in 1937-38, 8,063,000 cwt. Over the same period the price paid rose from 8s. 1d. per cwt. to 11s. per cwt. Between 1936-37 and 1937-38 the amount purchased fell although the production of beer increased; the reason for this is that the 1937 crop of malting barley was insufficient to meet brewers requirements.

*Bacon-pigs, Marketing Scheme Contracts.* — In accordance with the provisions of the Bacon Industry Act, 1938 (1), the Pigs Marketing Board has fixed the terms of the yearly contracts for the supply of bacon-pigs, during the year December 1938-November 1939; 1,479,226 pigs were offered. The maximum number that might be put under contract in this first contract year was fixed by the law at 2,100,000. The number actually put under contract is less than the total offer in 1937, when the contract system of the marketing scheme then in operation was declared null and void by reason of the insufficiency of the total offer.

This deficiency resulted under the old scheme in a re-establishment of a free market in bacon-pigs. The new scheme requires, however, registered pig producers and registered bacon curers to buy bacon pigs only under long term contracts. The Bacon Development Board is empowered to grant special exemptions from this provision, and has in fact done so for the months of December 1938 and January 1939. The number of pigs that may be so bought is limited by the Board and the prices paid are to be 6d. per score lb. less than the contract price.

The basic price for the standard bacon pig sold under contract has, according to the Act, to average 12s. 6d. per score lb. in the first contract year. The price has in fact been fixed at 17s. 6d. per score for each of eight months of the year; in February and March it is, however, to be 13s. and in October and November 12s. per score.

The basic price is the price to be paid when the standard feeding ration costs 8s. 6d. per cwt. The actual price to be paid is to be varied in accordance with variations in feeding-stuff prices. From 1936 to the summer of 1938 the officially ascertained price of the standard feeding stuff ration rose rapidly; at the beginning of 1936 it was about 7s. 9d.; by the end of 1936 it was over 9s.; in 1937 it rose from 10s. to about 10s. 4d. and remained at about this figure till the summer of 1938.

The new scheme was therefore evolved when feeding-stuff costs were high, and the new price regulations show a greater improvement on the old when feeding costs are high than when these costs are low.

Since the summer of 1938 the price of the standard ration has however fallen rapidly and in December, the first month of the new contract it was 8s. 4d., that is lower than the standard and for January 1939 it was 8s. 1d. The prices per score of the standard bacon pig sold under contract in these two months were accordingly less than the basic price, 12s. 6d., and were 12s. 4d. and 12s. 2d. respectively.

---

(1) See September, 1938 number of this *Chronicle* p. 434.

The allocation of the contracts among bacon curers has given rise to objections. One of the functions of the new Bacon Marketing Board is to allocate, on the instructions of the Bacon Development Board, production quotas to bacon factories. The quotas for the contract year 1938-39 were based on the hypothesis that 2,100,000 contract pigs would be available, the number permitted by the Act. As only about 1,500,000 pigs were obtained on contract, each factory's allocation of contract pigs had to be reduced in proportion. Every curer was not entitled to retain all the contracts he was able to obtain; the Bacon Development Board aimed at an equitable distribution of the total supply of pigs among all the bacon factories. Two reasons made such an equitable distribution highly desirable; the first is that the subsidy, having the object of stabilising prices both for pig-producers and also for bacon-curers is related to contract pigs only; the second is that as costs depend to a large extent on the volume of throughput and as all curers are required to pay the same price for contract pigs, no curer should be more short of supplies than another.

The removal of the 10 per cent. duty on lard imports, required by the Trade Agreement with the United States of America, has affected the operation of the pigs and bacon marketing scheme. The Bacon Industry Act, 1938, provided for given bacon prices in the first three years of the scheme. Now an amendment Bill, introduced by the Government provides for an adjustment of these fixed prices to changes in lard prices. A "notional", or standard price of lard is to be established; 65s. per hundred-weight for the first contract period, 63s. for the second, and 59s. for the third. The Minister is then to ascertain actual lard prices; and if the ascertained price exceeds or falls short of the "notional" price the bacon prices fixed by the Act are to be decreased or increased by 1d. per hundredweight for each 1s. per hundredweight difference. These provisions relate only to bacon made from long contract pigs.

*Fat Cattle Subsidy.* — The subsidy on fat cattle continues to be paid at the new rates established by the Livestock Industry Act, 1937. The total payment during the first year of the new rates, which began in August 1937, was about £4,000,000; this is about the same as the yearly total of the subsidy paid in the preceding years,—a subsidy on fat cattle was first introduced by the Cattle Industry (Emergency Provisions) Act, 1934.

A change in the regulations governing the payment of the subsidy, was made in the summer of 1938. The regulations provided that fat cattle certified for subsidy should be divided according to whether they conformed to an "ordinary" or to a "quality" standard. These standards were defined by the reference to the description of the animal, i.e. its conformation, finish and ripeness; it was also provided that an animal should have an estimated killing-out percentage of not less the 54 for ordinary standard and of not less than 57 for quality standard. The requirement that "quality" animal shall have a higher killing-out percentage has now been abolished. Although this involves no lowering of the effective standards of eligibility for subsidy, the new regulations will allow a greater proportion of the total animals on which a subsidy is payable to give a right to the higher quality subsidy. It is estimated that this will increase subsidy payments to £4,300,000 a year. The maximum subsidy allowed by the Act is £5,000,000 a year.

## SWITZERLAND

During the five months July to November 1938 imports of industrial products fell below the level of 1937 while those of agricultural products rose by 3.33 per cent. Exports in general showed a decrease, less marked in industrial than in agricultural products.

Period	Imports				Exports			
	Industrial products		Agricultural products		Industrial products		Agricultural products	
	Thousand francs	Index numbers	Thousand francs	Index numbers	Thousand francs	Index numbers	Thousand francs	Index numbers
January-June 1937 .	611,665	100 —	318,095	100 —	529,646	100 —	49,276	100 —
January-June 1938 .	522,940	85.49	258,471	81.25	561,452	106.01	56,900	115.65
July-November 1937 .	508,339	100 —	205,425	100 —	524,492	100 —	59,920	100 —
July-November 1938 .	461,776	90.84	212,256	103.33	520,848	99.31	52,948	88.36

The restrictions on imports underwent no modification, for the Department of Economic Affairs rejected all attempts to extend them or to re-introduce any which had been abolished. The only exception is the duty on asparagus in excess of the quota, which was raised from 35 to 60 francs (1). The course of prices in Switzerland was affected quite perceptibly by the decline in world prices during the early months of the year and their gradual rise from the beginning of June. After showing some decline, retail and wholesale prices in Switzerland have now returned to practically the same level as before the depreciation of the currency. Between January and June 1938 the index-number of wholesale prices fell from 113.6 to 110.6 (September 1936 = 100). The rise caused by the depreciation was therefore in the proportion of 10.6 per cent. The index-number of the cost of living for the same period (January-June 1938) also showed a slight decline, falling from 106.2 to 105.4.

### Cereals.

The greater part of the cost to the Confederation in respect of the country's wheat supply is incurred in the payment of a subsidy on the price of home-grown wheat, that is to say, the difference between the price guaranteed to growers and the actual price paid by millers to the Confederation. While the purchase price is fixed in accordance with Art. 6 of the wheat law, the selling price is based on the average net price of foreign wheat of equivalent quality, delivered free at the Swiss frontier, duty paid.

(1) XVIIth report of the Federal Council to the Federal Assembly on measures of economic protection against foreign competition. *Feuille fédérale*, No. 35 (August 31, 1938).

Should world prices decline and the purchase price of home-grown wheat remain unchanged, the cost of the subsidy would increase. When, in July 1938, the accentuation of the decline in the world prices of wheat betokened excessive reductions in the prices of Swiss flour and bread by the middle of the following month, the Federal Council for a moment contemplated reducing growers' prices. It was evident, however, that such a course would signify the abandonment of the principal object of the wheat policy namely, the expansion of cereal cultivation with a view to relieving the congested state of the livestock and milk markets and to increasing grain production.

The Federal Council was thus led to examine the possibility of increasing the customs duties on wheat from 0.60 to 3 fr. per quintal. This increase of 2.40 fr. per quintal on wheat and rye may increase the receipts of the State by 10 million fr. annually. The increase in the duties would justify an increase of 2.4 centimes per kg. in the price of bread; this, however, will not be necessary since the heavier duties will be largely counter-balanced by the decline in prices. There will be no increase in wheat prices unless the market is disturbed by unexpected events. Should quotations on the world market strengthen and thus tend to raise the price of bread wheat, the Federal Council will consider to what extent the duty should be reduced in order to avoid an increase in the price of bread (1).

In view of these considerations the Federal Council by a Decree of August 13, 1938, raised the import duties on wheat and rye by 2.40 fr. per quintal (2). The supplementary law of September 13, 1938, fixed the purchase prices of home-grown wheat of the 1938 harvest at the levels of the preceding year, namely: 36 fr. per quintal for type standard I; 37.50 fr. for type standard II; 38.50 fr. for type standard III; and 28.50 fr. for rye (3).

The provisions of the Law of November 5, 1937 on compensation to millers milling whole-meal flour was modified as follows by a Federal decree: the amount of the compensation is to be fixed periodically by the Department of Economic Affairs in accordance with the conditions of the breads cereals market (4).

### Fruits and potato market.

The improvement in the financial position of the State Alcohol Monopoly which began in 1936-37, was maintained in the following year, the profits of each year amounting to approximately 5 million fr. During the 1937-38 season, however, it was necessary to liquidate stocks amounting to 1,615,620 fr. of which stone-fruit brandy represented 1,426,117 fr. Most of this brandy was transformed into fuel and industrial alcohol. The result may be regarded on the whole as satisfactory in view of the exceptional apple harvest of 1937. The Monopoly succeeded in limiting its acquisitions of brandy to such an extent that the expenditure for brandy and alcohol derived from stone-fruit amounted to only 1,644,543 fr. as compared with the budget estimate of 5,770,000 fr. To attain so satisfactory a result the Monopoly encouraged in all possible ways fruit utilization other than distillation.

---

(1) *Feuille fédérale*, No. 36, (September 7, 1938). — (2) *Recueil des Lois fédérales*, No. 29 (August 17, 1938). — (3) *Recueil des lois fédérales*, No. 32 (September 14, 1938). — (4) *Recueil des lois fédérales*, No. 25 (July 13, 1938).

Sales did not realize the amount estimated in the budget but receipts from the taxes on specialities, direct sales and monopolies exceeded the estimates.

By a Decree of August 26, the Federal Council authorized the Alcohol Monopoly to take steps to reduce brandy production by granting subsidies for the promotion of fruit exports and for the maintenance of the fruit supply for home consumption. The Monopoly was also empowered to limit distillation (1).

In accordance with the arrangement made by the German-Swiss Commission, 70,000 quintals of perry pears of the 1938 harvest were exported to Germany and a further 80,000 converted into concentrated fodder juice.

The Federal Council decreed that apples and pears (whether fresh or dried), apple- and pear-juice and dried fruit residue may not be exported unless accompanied by a declaration that the quality of the goods is approved by the Fruit Union (2).

The Council has also given some attention to the improvement of fruit-growing. By a Federal Decree of November 12, 1938, the Alcohol Monopoly and the Department of Agriculture were authorized to take during the winter of 1938-39 and spring of 1939 such measures as would render possible the cultivation in orchards of table fruit and good cider fruit. Courses of instruction will be organized and model orchards set up. Expenditure for the re-conditioning of orchards will be refunded to the cantonal agricultural stations entrusted with the direction and supervision of the work. Subsidies will be granted for the encouragement of grafting (3).

The utilization of potatoes harvested in 1938 is provided for by a Federal decree (4) empowering the Alcohol Monopoly to organize purchases of home-grown potatoes. The Monopoly also organizes and subsidizes their transport from the producing areas to the centres of consumption. The basic prices were fixed at 7-10fr. per 100 kg., according to quality, with a possible increase for those delivered after November 15, 1938.

## Livestock.

The Federal Department of Economic Affairs has taken steps to encourage sales of livestock. They include a regulation entitling exporters to a premium not exceeding 25 per cent. of the cost price, as shown on the receipt, for bulls, cows and heifers bought and exported between August 22 and November 30, 1938. The exports, quality and price of the animals were subject to approval. Extraordinary subsidies were granted to stock-breeding associations for the purchase of male animals of pure strain during the 1938-39 breeding season. Facilities are granted for the transport by railway of cattle, sheep and goats intended for breeding, stock or slaughtering; for the transport of horses bought at certain fairs in stock-breeding districts, and of mutton sheep from mountain regions (5).

The reduction of 50 per cent. on railway transport charges for livestock was extended to January 1, 1939 (6).

---

(1) *Recueil des lois fédérales*, No. 30 (August 31, 1938). — (2) *Ibid.*, No. 32 (September 14, 1938). — (3) *Ibid.*, No. 40 (November 16, 1938). — (4) *Ibid.*, No. 30, (August 31, 1938). — (5) *Ibid.*, No. 28 (August 10, 1938). — (6) *Ibid.*, No. 40 (November 16, 1938).

## Milk.

As we have seen the Department of Economic Affairs wishes to reduce milk production as far as possible and it therefore issued an Order requiring commercial producers of milk to contribute to the guarantee funds of the Central Union of Swiss Milk Producers (1). Exemptions are granted in the following cases: farmers who produce during the year 1938-39 less than 800 kg. of milk for manufacture per hectare of cultivated land; farmers who produce during the same year per hectare of cultivated land between 800 and 1400 kg. of milk for manufacture, provided that this amount does not exceed the average yield per hectare in the two preceding years; farmers who produce during the year 1938-39 less than 3000 kg. of milk for manufacture provided that the milk conformed to the Swiss regulations for the delivery of milk.

The tax due under Art. 1 of the Order of April 23, 1937, regulating the collection of taxes on liquid milk, was raised from 0.5 to 2 centimes (2).

## FRENCH COLONIES, PROTECTORATES AND MANDATED TERRITORIES

With a view to directing the colonial trade currents towards the mother country, a Decree-law of May 24, 1938 (3), provides that, as an exception to the basic law of April 13, 1938 regarding the colonial customs system, the French Government is empowered to impose preferential export duties on colonial products.

Certain trade agreements concluded between France and other countries contain clauses affecting various colonial agricultural products.

## NORTH AFRICA

The wheat harvest reached the average in Algeria, being nearly 9 million quintals. In Tunisia, especially the northern districts, it was satisfactory. The Moroccan harvest was estimated at about 5,845,000 quintals; it was thus slightly larger than that of 1937 and substantially larger than that of 1936. The yield of soft wheat was average and the total crop was above the average, but both the yield and the total crop of hard wheat, the variety preferred by native growers, were poor. Barley, which competes with hard wheat as a native foodstuff, gave fair results in Morocco, but a mediocre outturn in Algeria and Tunisia. The Moroccan maize harvest was moderately good. While the spring drought had no serious effect on cereals, even on maize, it had serious effects on the fodder crops, and the forced slaughtering which was necessary caused a decline in livestock prices in the spring.

---

(1) *Recueil des lois fédérales*, No. 30 (August 31, 1938). — (2) *Ibid.*, No. 30 (August 31, 1938).  
— (3) *Journal officiel*, May 24 1938.

Wine production was plentiful. In Algeria alone it was estimated at 21.5 million hectolitres, a figure exceeded only by the phenomenal production of 1934. Stocks exceed 2 million hectolitres.

The olive harvest in Tunisia was, generally speaking, mediocre.

*Treaty with Great Britain regarding Morocco.* — In July 1938 France concluded a treaty with Great Britain replacing the Trade and Navigation Convention of 1856. This Convention was brought to an end in July 29, 1937 by an agreement which abolished British capitulations in Morocco.

*General price policy.* — The general price policy tends to become less rigid. The abolition of the rule that wholesale prices may not be raised without permission applies to Algeria, together with the qualifications involved in the abolition.

*Wheat.* — The minimum proportion of North African hard wheat which French manufacturers are required to use in the preparation of semolina, food pastes, sea biscuits and similar products is fixed at 65 per cent. (1).

In accordance with a Dahir of July 27, 1938 (2) the embargo on exports of hard wheat from Morocco has been raised.

The Decree-law of June 17, 1938 (3) relating to the reorganization of the Wheat Office (4) applies to Algeria.

In Algeria, as in the mother-country, (5) the growers' basic price of soft wheat was fixed by the Wheat Office at 204 francs and that of hard wheat at 205 francs per quintal. There are in Algeria various taxes on wheat similar to those in France.

In Morocco the Director of Economic Affairs fixed the mill price of soft wheat at 165 francs per quintal. As this includes transport and other charges, the growers' price is lower. Wheat prices are considerably higher in Algeria than in Morocco.

With a view to regulating the competition between French and Algerian semolina manufacturers, a committee of these manufacturers has been set up on which the mother country and the colony are equally represented (6). This Committee submits to the public authorities, for their approval, any modification or innovation that may appear advisable for the protection of the semolina market, for the better organization of the trade and, above all, for the reduction of the grinding capacity of the semolina industry.

*Barley.* — A Dahir of July 7, 1938, authorized the export from Morocco to France and Algeria of 200,000 quintals of malting barley during the 1938-39 season. (7) This figure is the same as that given in the Decree of June 1, 1938, which fixed the quotas to be admitted free of duty into France and Algeria from the French zone of the Sherifian Empire in the period June 1, 1938 to May 31, 1939.

A Dahir of July 21, 1938, authorizes the export to France and Algeria of a quota of 200,000 quintals of common barley, subject to an export duty (8).

---

(1) *Journal officiel*, November 25, 1938. — (2) *Bulletin officiel du Maroc*, August 12, 1938. — (3) *Journal officiel*, June 26 1938. — (4) See the analysis under "France" in the *International Chronicle of Agriculture*, 19 September, 1938. — (5) *Journal officiel*, September 2, 1938. — (6) *Journal officiel*, June 26 and July 28, 1938. — (7) *Bulletin officiel du Maroc*, July 8, 1938. — (8) *Bulletin officiel du Maroc*, July 29, 1938.

*Fodder.* — The export of fodder and straw from the French zone of Morocco was temporarily prohibited by a Dahir of July 22, 1938. (1)

*Wine.* — By a Decree of June 17, 1938, (2) a subsidy was granted to Morocco by the mother country for the relief of the wine market. (3)

## WEST AFRICA

*Customs system.* — According to the basic law relating to the colonial customs system, dated April 13, 1928, West Africa belongs to the so-called non-assimilated colonies, but France has undertaken to effect a gradual assimilation of West Africa with the mother country in respect of customs. A decree-law (4) was therefore issued entrusting to the central power until December 31, 1939, the responsibility of establishing customs tariffs for West Africa.

*Oils.* — A rebate is granted on groundnut oil exported to foreign countries, protectorates and mandated territories (5). This rebate may not exceed the export duty. It is fixed at 14 francs per 100 kilos net (6).

## INDOCHINA

The general index of wholesale prices at Saigon after a steady interval during June, declined in July, August and September. There was an increase in the price of rice on the same market in August. Maize prices tended downwards while rubber after rising in June, July and August, declined in September.

The proportion of the rice exports of Indochina taken by France exceeded 50 per cent. in 1936 but fell to 43 per cent. in the following year. Nevertheless, France continues to encourage exports of this product to foreign countries. The export duty on rice was reduced.

### INTERNATIONAL ORGANIZATION OF THE CACAO MARKET (1)

SUMMARY: Production and consumption. Antwerp International Congress. Brussels International Conference. Trinidad Planters' Plan. London Monetary and Economic Conference. British Memorandum of 1934. Recent developments. Price and trade statistics for cacao.

#### Production and consumption.

At the beginning of the 20th century the output of cacao fluctuated around one million quintals. Almost the whole of the cacao came from the American continent, with the exception of 70,000 or 80,000 quintals from S. Thomé and about ten thousand quintals produced elsewhere.

From then on the relationship between American and African production changed in favour of the latter. In Africa there are two types of plantation: S. Thomé, representing the European type of cultivation with modern methods and large properties, and the Gold Coast, with an almost entirely native type of cultivation on a village basis and organized in small properties. In the latter area Accra cacao is grown, which is very important in international trade.

In the years 1909-1913 America's output increased to 1,450,234 quintals. The most important producing countries were Ecuador with 375,544 quintals, Brazil with 316,441, Trinidad and Tobago with 225,858, the Dominican Republic with 200,114 and Venezuela with 160,525. During the same period the African output reached 801,767 quintals, the two countries contributing most to this total being S. Thomé and the Gold Coast with 354,128 and 349,052 quintals respectively.

The margin between American and African output decreased still further during the War: compared with an American production of 1,720,112, Africa produced 1,234,298 quintals. The main contributions to this total came from the Gold Coast with 740,788 quintals, S. Thomé with 318,433 and Nigeria with 98,883 (during the period 1909-1913 the last named country only produced 33,702 quintals).

During the years 1919-1921 the relationship between the output of the two continents changed completely; while the African output reached 2,079,043 quintals (of which the Gold Coast contributed 1,470,369 and Nigeria 205,954, S. Thomé remaining at 322,440), American output was only 1,804,112 quintals.

This trend has since been accentuated. During 1927-1928 and 1931-1932 production reached 3,530,000 quintals in Africa (2,373,000 from the Gold Coast)

---

(1) *Volume préparatoire du Congrès international des fabricants de chocolat et de cacao d'Anvers, 1930, p. 129.*

and only 1,940,000 quintals in America, and in 1936-37 4,990,900 quintals were produced in Africa (2,731,000 from the Gold Coast) and 2,300,000 quintals in America <sup>(1)</sup>.

Several varieties of the genus *Theobroma* are known, but of these only the *Theobroma Cacao Linnaeus*, is cultivated. There are two varieties of this: the *Criollo* and the *Forastero*. The first is less productive and more delicate: it yields a high quality cacao. *Forastero* is stronger, more productive and less susceptible to disease; it yields cacao for ordinary consumption and supplies by far the greatest part of the world output.

Originally *Criollo* predominated but *Forastero* has steadily overhauled it and its output has now reached very high figures. *Accra*, which is so important in world trade, is a variety of *Forastero* <sup>(2)</sup>.

On the international market there was generally equilibrium between the production and consumption of this product before the War, but during the War this was destroyed, chiefly on account of the fall in imports of European countries.

After the War there was a brisk recovery in demand, which later fell off somewhat. In 1925 demand again increased, reaching its highest point in 1927.

During this period prices rose, owing to natural factors and agreements between the leading business organizations of West Africa, which were endeavouring to raise prices by restricting supply.

The Accra Pool was founded as a result of these agreements. At first it enjoyed an increase in prices, but in the end suffered heavy losses owing to reduced consumption and the necessity of placing its stocks of cacao on the market after some time, to prevent them deteriorating.

The fall in prices which had at first been caused by the disparity between consumption and a production greatly stimulated by the rise in prices between 1925 and 1928, increased with the great depression <sup>(3)</sup>.

### Antwerp International Congress.

At the International Congress of Chocolate and Cacao Manufacturers at Antwerp in 1930, a majority of countries agreed as to the desirability of setting up an international Office of chocolate and cacao manufacturers. All the principal countries gave their general support <sup>(4)</sup>. Further, several members advocated that one of the functions of the Office should be an international sales campaign <sup>(5)</sup>.

<sup>(1)</sup> *International Yearbook of Agricultural Statistics*. International Institute of Agriculture, Rome, 1919-21, p. 18; 1937-38, p. 322.

<sup>(2)</sup> *Volume préparatoire* cited, p. 95.

<sup>(3)</sup> Klopstock F. — *Kakao: Wandlungen in der Erzeugung und der Verwendung des Kakao nach dem Weltkrieg*. Leipzig 1937, pp. 105-110.

<sup>(4)</sup> *Compte rendu officiel du Congrès international de fabricants de chocolat et de cacao*. Antwerp, 1930, p. 113.

<sup>(5)</sup> *Volume préparatoire du Congrès*, 1930 cited pp. 313, 317, 322 and 326.

The Congress approved the statutes of this Office, which was to study all questions relating to the chocolate and cacao industry, to solve problems of common interest, to suggest solutions to the national associations, and to collect and circulate all information of interest to the cacao and chocolate manufacturers and their associations. It was to ensure that its decisions were put into effect as far as possible <sup>(1)</sup>.

As we have said, several of the delegations recommended the launching of a publicity campaign. The representative of the Swiss Cacao Manufacturers Syndicate emphasized the need for first examining methods of collecting the annual funds for this campaign, and he pointed out that the whole amount needed by the world chocolate industry for this purpose would have to be calculated and the international distribution of advertising expenditure on chocolate goods studied. A tax of a pound sterling on each metric ton of cacao harvested in countries producing cacao beans might be levied. A contribution might also be asked from each chocolate manufacturer proportionate to his turnover, or even to the number of workers employed in his factory each year; but all such measures offered very great difficulties <sup>(2)</sup>.

The British industrialists were not convinced of the need for the Office, but did not declare themselves against it if its role was to be merely advisory. As regards international publicity to increase consumption, that was of the greatest interest to manufacturers, but there were two great difficulties in carrying it out: (a) obtaining the necessary funds and (b) apportioning such funds. The British members pointed out that attempts to set up a national publicity pool had always failed, partly because no equitable principle for redistributing contributions could be found. The difficulties in the way of financing an international advertising campaign which the participants would be unable to supervise would be vastly greater, if not insurmountable. Advertising called for heavy expenditure and therefore large resources. Without this the plan would not give an adequate return. Nevertheless, the British members did not take any definite decision <sup>(3)</sup>.

### Brussels International Conference.

In 1932 at the request of the International Office of Chocolate and Cocoa Manufacturers at Brussels, the Belgian Government called an international conference of official delegates of countries producing cacao beans. The main object was to combat the depression from which cacao planters were suffering by establishing prices giving a normal return to the planters and traders of cacao beans. The method proposed was to create an increase in demand by an international advertising campaign in support of cacao products, while keeping the sale price of these products as low as possible.

The conference met on September 12, 13, and 14, 1932. It concluded that such a campaign was desirable, and prepared the preliminary draft of an

---

<sup>(2)</sup> *Volume préparatoire du Congrès international*, 1930, cited, p. 326.

<sup>(3)</sup> *Volume préparatoire du Congrès international*, 1930, cited, p. 324.

international convention which the Belgian Government was to submit to the various States, requesting their views and proposals. The Belgian Government was then to re-summon the conference as soon as possible so that a definitive plan could be drawn up and submitted to the interested States for signature (<sup>1</sup>).

In the preliminary draft the contracting parties undertook to form an international pool for organizing, subsidizing and supervising international publicity for cacao.

By international publicity was understood (1) all measures aimed at developing the use of products based on cacao (publicity in the strict sense); and (2) all technical and scientific research to improve cacao growing.

The international publicity fund is to be formed by levying a uniform payment on all cacao beans on leaving the signatory countries producing them. This payment was to be levied by the customs offices and be equivalent to one gold pound sterling per metric ton of exported cacao beans. The levy was to be paid either by the planters separately, or by various intermediaries, before permission to export could be obtained. It might be paid by means of six months bills whose issue would be governed by special regulations.

This rule was made to prevent the charge falling on the planter, as the exporter might be tempted to lower the price paid to the planter by the amount of the levy. The exporter might be afraid of not recovering the amount of the levy or of having to advance it over a considerable period before recovering it. Under the rule adopted the exporter would be authorized to pay the levy before exportation, by means of six months bills. It would be invoiced separately by the various exporters and intermediaries in such a way that its incidence fell on the manufacturers of products based on cacao. The exporter, therefore, would not in fact pay the levy until he had realized the price of the cacao plus the amount of the levy. Thus, as the exporter as a rule gets paid after three months at the latest, and very frequently at the time of shipment, it can be said as a general rule that the exporter would on an average also gain three months interest on the amount of the levy.

The draft plan added that when one of the signatory countries producing cacao beans had factories manufacturing cacao beans on its own territory, the competent authorities would levy the payment on the same basis before the cacao beans might be manufactured in these factories.

The levies paid to the International Office would form the International Publicity Fund administered and directed by the International Office on its responsibility and under the supervision of the contracting States.

The funds at disposal each year would be distributed as follows:—

A. — Subvention for publicity properly so called in the different countries according to the possibilities of developing the use of products based on cacao, whether or not these countries were manufacturers of products based on cacao.

1. The share of this payment received by countries possessing such industries would be based mainly on national consumption for the preceding

---

(<sup>1</sup>) Conférence internationale du cacao. *Compte rendu officiel*. Brussels 1932, pp. 7, 147 and 155.

year. These sums would be calculated on the basis of copies of official statistics, certified by the competent authorities of the country as conforming to the originals and indicating:— (a) The quantities of cacao beans produced, imported, exported, re-exported, put in stock, taken out of stock or entering the country in transit, during the preceding year; (b) The quantities of different types of products based on cacao or derived from cacao beans which have been imported, exported, re-exported, put in stock or entering the country in transit, during the preceding year.

2. The share of countries not producing products based on cacao would be a percentage fixed by the International Office on the basis of the probable consumption in these countries.

B. — Reserve Fund for the International Office to organize and administer, or subsidize, technical and scientific research of general interest.

C. — Reserve Fund for general organization, administration and supervision of publicity by the International Office.

The International Office would be authorized to deduct annually 10 per cent. of the funds for publicity, with the object of organizing and administering, or of subsidizing, technical and scientific research of general interest aimed at improving cacao growing.

If a national association of cacao planters considered that it was not worth while to devote any part of the resources at disposal to technical and scientific research affecting it or the colonies of the countries in which it was established, that association's share will be increased by the proportionate sum which had not been allotted to technical and scientific research. The International Office would, however, first ask the opinion of the Government concerned.

The International Office would be responsible for the organization, administration and supervision of publicity, and decide as to its general lines.

The Belgian Government submitted the results of the Conference for consideration by the Governments concerned.

In a note published in May 1933 the British Government, whose colonies export a large part of the world output, raised several objections against the plan in question and suggested that in any case the moment had been badly chosen for conducting an international publicity campaign chiefly on account of the monetary restrictions in force and in general of the limitations on international trade <sup>(1)</sup>.

After this, the idea of carrying out the scheme in question was abandoned.

### Trinidad Planters' Plan.

Another attempt at international action to improve the cacao position began early in 1933.

The Trinidad planters put forward a plan for regulating the cacao market. The Trinidad Chamber of Commerce submitted this to the British Colonial Secre-

---

<sup>(1)</sup> Klopstock, *op. cit.*, p. 128.

tary with a view to promoting a conference of representatives from the producing countries to consider the plan. With the aim of raising prices of Accra to some specified level, this conference, which is usually known as "Z", sought to induce the Governments of producing countries to build up stocks from part of the surplus output. The stocks, which would be placed to the account of an organization created by the conference, would be drawn upon by the Governments when prices rose above the basic level. This plan was not carried out, but it led to an investigation of the subject by the London Monetary and Economic Conference and by the British Government <sup>(1)</sup>.

### London Monetary and Economic Conference.

The sub-committee of the London Monetary and Economic Conference, which was instructed to study the co-ordination, production and sale of cacao, submitted a report which was approved by the conference. In its report the sub-committee suggested that the position of the cacao market should be properly studied after the conference, account being taken of present production and consumption and existing stocks of various qualities. The sub-committee invited the countries most interested in cacao production to consider the matter and as soon as possible to submit to the General Secretary of the Conference their remarks and proposal as to the convening of a meeting of experts to study the organization of the production and international trade in raw cacao <sup>(2)</sup>.

### British Memorandum of 1934.

In 1934 after consulting the Governments of the colonies interested and the representatives of the cacao trade and industry in the United Kingdom, the British Government drew up a memorandum making use of a report which it had submitted to the London Conference. This very interesting memorandum begins by sketching the development of the production and consumption of cacao over a period of many years, and proceeds to point out the dangers of the situation for the future. The memorandum shows that prices have fallen to very low levels for Accra, about a third in terms of sterling and a quarter in terms of gold, of the prices ruling immediately before the War. It attributes this fall in part to the general fall in prices and in part to the size of the stocks held.

Stocks in consuming countries plus quantities afloat at the end of September were 160,000 metric tons in 1926, 218,000 in 1927, 205,300 in 1928,

<sup>(2)</sup> *Rapports approuvés par la Conférence*. July 27, 1933, League of Nations. London Monetary and Economic Conference C. 435 M. 220 1933 II.

223,700 in 1929, 239,800 in 1930, 222,300 in 1931, 232,700 in 1932 and 310,000 in 1933.

The British Government considers that the first step away from this position and towards a rise in prices is more co-operation between the cacao sellers, with a view to an agreement on selling prices. Sellers generally act independently, and their position is much weaker than that of buyers. The latter, apart from a limited number of small buyers, are represented by a few large manufacturing concerns who as a rule hold large stocks and who are therefore in a position to hold off the market for a substantial period.

One of the objects of a sellers' agreement should be to fix a basic price. As Accra is the most important grade of cacao, and as the prices of other cacaos depend to a large extent on the prices of Accra at Liverpool, the agreement should base prices on that of Accra.

At the same time the British Government expressed the view that any very great increase in prices would not be of general advantage, since it would limit consumption and stimulate production in West Africa.

As regards the proposal for active co-operation between producers in different countries, the memorandum suggested that this would be facilitated by forming a small international organization to look after production and, with the assistance of the principal consuming countries, consumption. The function of this body would be to watch closely increases in production and stocks and the course of prices, to advise the Governments concerned if there were indications that production was at an excessive rate and to discuss measures for rectifying the situation. It might also conveniently collect information regarding customs tariffs in the consuming countries, import prohibitions and restrictions and all measures tending to reduce the consumption of cacao. Thus producing countries would be in position to decide whether it was desirable to make representations to consuming countries with undue restrictions.

If the measures proposed were not adequate to ensure reasonably remunerative and stable market prices, the British Government thought that the growers themselves—if well enough organized—or the governments concerned, might be asked to form a joint fund for holding stocks off the market until they could be absorbed. This fund would be financed by a levy on cacao exports. Naturally there would be an element of speculation in operating this fund, unless there were some assurance that future production would be kept down to a figure allowing for the absorption of surplus stocks within a reasonable period. The British Government would be very reluctant to invite British producers to subscribe for such a purpose if it did not receive a formal assurance that all countries in which an increased output is possible had undertaken to limit production in accordance with an agreed programme over a period of years <sup>(1)</sup>.

---

(1) Gordian, "Periodical devoted to the cultivation, trade in and manufacture of cocoa, sugar and related products". Hamburg. March 12, 1934, p. 20.

As a result of the memorandum the calling of a conference was considered to discuss the question of the cocoa market, but although it was announced several times as about to take place, it has not met so far <sup>(1)</sup>.

Meanwhile, the prices of this product, which had stayed at a low level during 1933 and 1934, showed a distinct rise during 1936 and up to the beginning of 1937. *Accra* which was quoted in London at 23/8 (yearly average) per 112 pounds (50,802 Kg.) in 1933, 22/10 in 1934 and 23/3 in 1935, rose progressively in 1936 from 23/6 in January to 28/- in June, to 33/7 in September, to 50/7 in December, to 55/7 in January 1937, to fall again after the general recession to about 35/- in June and September and to 25/7 in December <sup>(2)</sup>.

### Recent developments.

The 1937-38 season opened with the formation of a Buying Cartel of the principal European exporters of West African cocoa. The Gold Coast planters at once opposed it by boycotting sales <sup>(3)</sup>.

The agreement between exporters was suspended from April to October, the date which had been fixed for publishing the report of a commission of inquiry, appointed by the British Colonial Secretary, on the position of the cocoa market in West Africa <sup>(4)</sup>.

At the same time, the planters' boycott ended, having lasted about six months, and the exportation of cacao from the Gold Coast was controlled by export permits. At the end of the season this system ceased too.

Despite the sellers' boycott and the system of export permits, the movement of prices in 1938 was not favourable. For *Accra*, the season opened with a price of about 30/- per cwt. in April; when boycotting ceased it fell to 25/- and by the end of May to 18/-. It then recovered somewhat and reached from 23/- to 25/- during the last three months of the season <sup>(5)</sup>.

The British Commission of Inquiry which has just published its report on the cacao position in West Africa denies that buyers caused the fall in cacao prices by the agreement which we have just mentioned; this fall coincided with a general depression of prices on the world markets. It recognizes, however, that such an organization lays itself open to accusations of this kind.

The Commission proposes a fresh solution. The agreement between the buyers should be broken off, but producers should be organized on the model of the British Agricultural Marketing Boards. The Commission also expressed the view that West Africa alone could raise world prices only very little. The possibilities of a world agreement must therefore be studied <sup>(6)</sup>.

## LAND SETTLEMENT IN FINLAND <sup>(1)</sup>

SUMMARY:— Position before settlement. — Land settlement organizations. — Problem of tenant farming. — Problem of the landless farm labourer. — Settlement on State lands. — Loans for dwellings. — Farming of new lands. — Preserving the settlements. — Results of land settlement.

### Position before settlement.

As a result of social developments in the 19th Century, farmland in Finland was badly distributed at the opening of the 20th Century, and the State took measures to alter this position in favour of the agricultural proletariat. Thus internal land settlement began in 1900.

As in most of Europe, the population increased fairly rapidly, rising from 1.1 million in 1815 to 3.3 millions in 1915, that is threefold. Owing to the land system, however, the number of properties did not increase at the same rate, so that the increase in population resulted in larger numbers of tenant-farmers and agricultural workers.

In 1901 there were 33 million hectares of agricultural land, of which 13.1 million hectares belonged to the State, 0.4 millions to communes and parishes, 17.3 millions to owner farmers and 1.2 millions to persons not engaged in agriculture. Subtracting the State lands from the total area, 19.9 million hectares remained, 8.7 of which were occupied by properties of less than 250 hectares, the rest having properties of over 250 hectares.

In the same year the number of rural families was 478,100 of which only 110,600 (23.1 per cent.) had full ownership of their land. About 160,500 (33.6 per cent.) rented their land or held it in métayage and 207,000 (43.3 per cent.) had no rights in the land at all. Of the farmers and métayers 100,700 owned less than 3 hectares. These figures include forest and uncultivated land as well as cultivated lands. The rural population was then 2,171,000 of which 1,547,000 (71.2 per cent.) lived by agriculture. Of this farm population, which needed land more than any other class, 604,000 persons (39 per cent.) were owner farmers, 352,000 (22.8 per cent.) were tenant farmers and 591,000 (38.2 per cent.) were farm labourers.

State intervention was therefore needed to improve the lot of both tenant farmers and labourers. Land settlement would solve the problems of tenant farming and métayage and enable agricultural workers to acquire land, and also assist small farmers and agricultural labourers to erect buildings on their lands.

---

<sup>(1)</sup> Report supplied to the International Institute of Agriculture by the Finnish Ministry of Agriculture.

### Land settlement organizations.

There was no official organization in Finland dealing specifically with land settlement until 1906, when the post of land settlement inspector was created. The inspector dealt with all matters relating to land settlement, which included supervising the work of the communes in this respect. In 1918 a central organization was set up for the general administration of land settlement, forming an independent section of the Ministry of Agriculture. It was completely reorganized at the beginning of 1938 under the name of Land Settlements Department of the Ministry of Agriculture, all operations relating to land settlement being centralized with it.

This department supervises the work of the land settlement inspectors, each of whom is allotted a settlement district. The country is at present divided into twenty such districts. The rural communes have supported the work from the outset, and since 1919 each has had a land settlements committee. Half of the committee members must be tenants or owners of farms formed for land settlement. The work of these committees is extremely useful. They assist and give advice to farmers who do not own their land, help and supervise the settlers and furnish the competent authorities with their knowledge of local conditions. The land settlement inspector gives advice to the committee of his district and supervises its work, while he also advises and assists the settlers. He also carries out the instructions of the Land Settlements Department of the Ministry of Agriculture. For example he surveys lands to be bought for settlement and draws up plans for settlement.

In addition to these permanent organizations, there are *ad hoc* settlement commissions to carry out the settlement plan for State or expropriated lands. The composition of the *ad hoc* commission is decided by agreement between the surveying and land settlement authorities, forest services and the land settlement committee of the commune concerned.

### Problem of tenant farming.

The system of tenant farming goes back to the 18th Century in Finland, but it did not become important until the 19th Century. The tenant farms formed part of an estate, so that one estate might contain several farms. The lands rented consisted of cultivated lands varying in area from 3 to 10 hectares or dwellings with generally less than one hectare of cultivated land. The tenant farmers had several matters of complaint, the chief being their close dependence on the landowner and the resulting instability of their position. In 45 per cent. of the cases leases were verbal or else easily terminable.

The first improvement in the position of tenant farmers was introduced with the law of 1902 and the decree of 1909, by which all leases had to be sanctioned in writing and stand for a period of from 25 to 100 years. The laws also provided that at the expiration of the lease farmers should be compensated for improvements carried out.

The problem of leaseholds was not completely settled, however, and it was becoming a difficult social question which could apparently only be finally solved by transforming the tenant farmers into small landowners. This was done shortly after the Great War.

In 1918 a law was passed by which farms leased from private owners might be converted into small properties. Subsequent laws gave similar treatment to farms leased from parishes and the State. These laws gave farmers the right to purchase the land which they occupied, the price payable being less than that ruling before the War. The farmer might, if he desired, act through the State. In this case, the State paid the landowner by means of bonds and the State was repaid by the buyer in yearly payments of 6 per cent. for farms and 8 per cent. for pieces of land with a dwelling, including interest at 5 per cent. In 1936 the rate of interest was lowered by law to 3 per cent.

Tens of thousands of farmers became landowners as a result of this legislation. By the end of 1936, 65,698 farms had been acquired with full ownership by their farmers and 54,885 pieces of land with dwellings had been acquired by their occupiers. Almost all tenants have become landowners.

### **Problem of the landless farm labourer.**

Private and State lands have been used to provide land for agricultural workers.

There are two possible procedures for settlement on private lands. The settler may borrow privately with a view to acquiring land considered suitable for settlement by the authorities. Or the State may buy land, draw up a plan for settling it and then sell the farms created in accordance with this plan. So far the former type of sale has been used most, though in the last few years the State has bought more land for settlement than before. It should be noted that expropriation as allowed by the land settlements law of 1922 has been used very little. The new land settlements law of 1936 also contains regulations for expropriating parish and commune lands and land belonging to companies and persons trading in wood. Ordinary estates belonging to individuals may also be expropriated if the small farms created before 1936 need enlarging. It is still too early to judge how far these regulations will be applied.

Settlement on private property is carried out with the help of a public land settlement fund which was formed in 1898 and reorganized in 1920 and which is financed from credits granted by the State. By the end of 1937 it had funds amounting to 603.2 Finnish marks, 513.6 millions of which were funds proper and 55 millions loans from the State. These funds are used almost exclusively for loans to the land settlement offices of the communes, which guarantee to repay the loans. These land settlement offices, which are administered by the committee of the commune, then lend to the settlers. The final decision regarding requests for loans rests with the Land Settlements Department of the Ministry of Agriculture. The loan offices may grant loans up to 50,000 Finnish marks for the purchase of land, or for the repurchase by one inheritor of the

shares of his co-inheritors in small properties. The latter loans are regulated by the 1936 law and were first granted in 1938. As will be shown below, the loan offices may also grant loans for building and improvement work.

Loans for the purchase of land and for the repurchase of shares in inheritances are repayable by yearly installments of 4 per cent. and 5 per cent. respectively, including interest at 3 per cent.

At the beginning of 1938 there were loan offices for land settlement in 506, *i. e.* nearly all, rural communes. By the end of 1937 the land settlement fund had granted to landless individuals 15,029 loans to acquire cultivable lands of from 15 to 40 hectares; 10,215 for land for settlement, of from 1 to 2 hectares, and 19,528 to enlarge farms and lands for settlement; the total amounting to 247.5 million Finnish marks. The land settlement fund has granted loans to certain land settlement co-operative organizations and communes for the purchase of land, though there has been very little settlement by these means.

By the end of 1937 the State had bought 222,600 hectares of land for settlement. Plans for settling land bought in this way are drafted and in some cases the holdings thus formed are cleared or built upon before they are handed over to the settlers. This work helped to relieve the unemployed during the depression. The purchase price of these farms is repaid to the State on the same conditions as loans for settlement. By the end of 1937, 4,081 farms and 1,037 settlement had been formed on lands bought by the State; and 1,199 pieces of land had been sold to enable small landowners to enlarge their holdings. In all the State had dealt with a total of 208,116 hectares. Woodlands not needed for farms remain part of the State lands.

### Settlement on State Lands.

Woodlands, estates of Government officials and other State lands are also liable to be used for land settlement.

In Finland the State owns nearly 13 million hectares of forests, amounting to about 37 per cent. of the nation's territory, the majority lying in the North and East. Naturally some of these forest lands are suitable for settlement. The land may be allotted for cultivation either at the suggestion of the interested parties, who select the land desired and have it approved by the Government, or at the suggestion of the Government, which may plan the creation of a whole group of farms. In the latter case the State frequently carries out some of the preliminary work, such as draining marshes and laying down roads. For some years it has also erected necessary buildings and even cleared fields before selling them to the settlers. By these means 2,062 pieces of State lands had been allotted for cultivation and 767 for building houses by the end of 1937, while 550 pieces had been sold to small landowners to enable them to enlarge their holdings.

Estates of Government officials, numbering nearly 900, covered about 270,000 hectares. The majority of these estates were military residences which had been set up in the 17th Century and the usufruct of which afforded officers their

remuneration, in accordance with the military system of the time. Their original purpose having disappeared these estates were for several decades farmed by tenants. The process of dividing them up and leasing the pieces was begun in 1915. By a law of 1926 the pieces could be ceded with full ownership. When the leases ran out the Government drew up a plan for settling the land which provided for the creation of farms and the dividing up of land for dwellings. Such land was sold separately from the residence which was sold in its turn with the land immediately surrounding it. The State conserved the forests as they were not needed for the new farms. By these means 931 farms had been formed and 649 pieces of land divided up for dwellings by the end of 1937, while 861 pieces had been sold to enlarge small holdings and to add to dwellings with insufficient land.

Of State lands not forming part of the forests or belonging to residences of officials, very little has been used for land settlement.

The repayment of the cost of land coming from the State lands is regulated in the same way as that for other settlement lands.

### Loans for dwellings.

The loan offices for land settlement lend to small land-owners and agricultural labourers for building purposes. From 1922 the State also granted credits to the rural working population specifically for building purposes. In 1937 a special loan office was set up which was in 1938 merged into the land settlement fund <sup>(\*)</sup>.

This amalgamation resulted in the credits for working class dwellings being granted through the land settlement loan offices of the communes. By the land settlements law of 1936 these offices may grant credits of up to 25,000 Finnish marks for building on farms and up to 15,000 Finnish marks for building on land allotted almost exclusively for the construction of dwellings. The loan may not exceed 75 per cent. of the expected cost of construction if the house is built on the borrower's own land, and 50 per cent. of the cost if built on leased land. The borrower must have his building plans approved by the land settlement authorities and the latter may in some circumstances supply model plans. The building loans are repayable in annual instalments of 5 per cent., including interest at 3 per cent.

By the end of 1937, 356.2 million marks divided between 53,202 loans had been granted for building purposes. About half of these loans were granted to small farmers, the other half to agricultural workers.

---

<sup>(\*)</sup> A similar loan office contributes towards the construction of small family dwellings in towns, villages, etc., but it does not come under the aegis of the land settlement authorities.

### Farming of new lands.

A large part of the lands for settlement were uncultivated, though on the majority of farms, it is true, some of the land was cleared and even necessary buildings built before the land was handed over to the new owner. But generally the new owner had to start at once preparing fields and buildings. To do this he could obtain a moratorium of not more than ten years on his annual payments to the State and to the loan office for land settlement on condition that the proposed improvements were carried out. A moratorium of ten years is granted to all settlers on farms formed out of the State forests.

As was said above, settlers can obtain credits for building by means of the loan offices for land settlement. These also grant loans for clearing and improving arable and pasture lands. By the end of 1937, 21 million marks had been distributed between 8,403 loans in this class. The conditions of repayment are the same as for building credits.

For some years, bounties for breaking up and cultivating new land have been given and these are generally used to pay off loans made to the settlers by the State. In 1937 and 1938 the State tried the experiment of granting interest free loans to enable settlers to buy equipment.

The authorities also watch over the development of the settlers into good farmers, and a special system of instruction has been worked out, in which an important part is played by instructors. The instructors are allotted an area by the land settlement authorities and must give instruction to certain settlers in the area indicated by the authorities, the cost being paid by the State. The course lasts for from one to ten years according to circumstances. Having examined the existing position and possibilities of the holding, the instructor works out a general scheme, plans for the yearly work of the farm and, if necessary, plans for clearing the land and for building. In 1938 about 5,400 holdings enjoyed this practical instruction.

### Preserving the settlements.

There was much discussion at the beginning of the century as to how to keep settlement farms in the hands of the settlers. The question was whether it was better to grant the land in hereditary emphytheusis or freehold. Emphytheusis has not been used in Finland for internal settlement, but for some time a tenant system has been used by which the lease is automatically converted into freehold when the sum of rent payments reaches the value of the property, including the interest on this value. Direct sale has already taken the place of this system, except with farms where the State has had to perform the clearing and building. In these last cases, the farms are generally given to candidates for a probationary period of not more than 10 years, and they do not acquire the property until after this probationary period.

Although land settlement farms are held in freehold, it was considered desirable to restrict this freehold in the interests of land settlement, and to

this end the 1936 law specified that the settler might not sell his land to a person already owning land without the permission of the land settlement authorities and he may not leave or partition it. Nor could he sell woodlands in his holding without permission. Infringement of these rules would make him liable for repayment of the State's loans, plus a fine. Settlement farms remain under these restrictions for 20 years, and over this period the farms are kept on a register at the Land Settlements Department of the Ministry of Agriculture. These regulations only affect farms proper and land to extend ground for housing purposes, though the ground itself does not come under the regulations.

### Results of land settlement.

The following figures show the results of land settlement up to the end of 1937 :—

Class of land	Number of new farms	Number of new small farms with dwellings	Total	Area in hectares
Bought by private agreement and by means of credits for land settlement . . . . .	15,421	10,215	25,636	556,011
Bought by the State . . . . .	4,081	1,037	5,118	208,166
Acquired by rural communes and land settlement co-operative unions with the help of credits from the State . . . . .	576	101	677	17,011
Land from State property . . . . .	3,979	1,439	4,518	240,555
	23,157	12,792	35,949	1,021,743

In addition as was shown above, 65,698 farms and 53,885 dwellings which were formerly rented have been acquired by their tenants.

An official commissions is investigating the position of small farmers in Finland, though its report on the effects of land settlement has not yet been published. But at least it is known that the majority of tenant farmers whom the State has enabled to buy land on advantageous terms have become prosperous small landowners.

Nevertheless, a large number of settlers had great initial difficulties. However, these were overcome by the moratoria on annual payments, and in some cases by reductions on the sale price. Very few of the settlers have been reduced to a forced sale of their land.

There has been a great change in the social and economic condition of the rural population since the beginning of the century, and especially since the Great War. The total number of persons living by agriculture has hardly increased, for labour has been attracted by the great developments in other branches

of the economy. On the other hand, the relationship between the different groups forming the agricultural population has been greatly altered:

Agricultural Population	1901	1910	1930
Owner farmers. . . . .	604,000 (39.9 %)	748,000 (39.1 %)	1,238,000 (62.9 %)
Tenant farmers . . . . .	352,000 (22.8 %)	383,000 (20.0 %)	112,000 ( 5.7 %)
Agricultural labourers . . . . .	591,000 (38.2 %)	781,000 (40.9 %)	617,000 (31.1 %)
Total . . . . .	1,547,000 ( 100 %)	1,912,000 ( 100 %)	1,967,000 ( 100 %)

Thus the percentage of the population farming its own lands has risen between 1901 and 1930 from 39.1 per cent. to 62.9 per cent. of the total population living by agriculture. This change, which is in the main the result of land settlement, has led to a considerable improvement in the social condition of the peasants.

## **INTERNATIONAL CHRONICLE OF AGRICULTURE**

### **BELGIUM**

#### **General price policy.**

In 1938 the position of agriculture again became critical after the improvement recorded during the years 1935-1937. The Belgian *Boerenbond* agricultural index number shows that the margin between selling prices and the cost of production of agricultural products is still very considerable:

	Selling Price Index	Cost of Production Index	Margin Index
	1909-1914 = 100		
1935 . . . . .	502	630	128
1936 . . . . .	555	689	134
1937 . . . . .	604	736	132
1938 March . . . . .	612	758	146
April . . . . .	611	760	149
May . . . . .	653	767	114
June . . . . .	662	767	105
July . . . . .	632	766	134
August . . . . .	631	754	123
September . . . . .	641	748	107
October . . . . .	656	748	92
November . . . . .	650	744	94
December . . . . .	646	751	105

This situation led the *Alliance Agricole Belge*, a union of Walloon farmers, horticulturists and small stock farmers to make clear to the public authorities at its recent general assembly the great importance of the following recommendations<sup>(1)</sup>:

1. The re-establishment of a normal balance between arable and stock farming especially by an adequate and stable "revalorization" of all cereals with a view to extending the area under crops and so avoiding a dangerous over-production of dairy and animal products.
2. Reduction of the often excessive margin between the price paid to producers and that charged to consumers.
3. Reserving the home market for Belgian products and improving its organization.
4. Use of Belgian agricultural products by all Government and public institutions.
5. A revision of trade agreements in the interests of agriculture.

The economic position of Belgian agriculture depends in part upon the possibilities of selling the surplus production of certain branches abroad, so that all official circles are concentrating their attention upon the problem of exporting agricultural produce.

In May 1938, in reply to these recommendations, the Government reaffirmed its statement of June 1936, expressing its intention of protecting the home market and of pursuing a policy of reducing cost prices and organizing the farmers. Everything possible will be done to improve farming equipment and to guarantee a profit margin to the farmers.

It was recognized that the Government would first of all have to be supplied with information about the agriculture, industry and trade of the country before deciding on the financial, economic and social measures for carrying out this programme. On November 16, 1938<sup>(2)</sup>, therefore, a Royal Decree ordered the Central Statistical Office to prepare statistics of the various branches of production and trade in Belgium.

In addition, a Royal Decree of August 26, 1938<sup>(3)</sup> set up a Ministerial Committee for economic co-ordination. The Committee whose views are submitted to the Council of Ministers is to study in particular such matters as measures to meet the crisis, the utilization of labour, tendencies of the whole of the national economy or certain of its branches, market equilibrium at home and abroad and the effects of social, fiscal and transport policy upon production and trade.

By a Royal Decree of August 13, 1938<sup>(4)</sup> regional and national commissions composed of representatives of producers and traders in farm and garden produce have also been set up, to decide on the standard prices to be paid to producers. They will take account of the condition of the market, costs of production and, where necessary, the cost of transport.

## Cereals.

Expectations of very good crops in wheat producing countries caused a heavy fall in the prices of cereals. From January to October 1938 on the principal Belgian markets they fell, on the average from 134.21 francs per quintal to 111.41 francs for wheat; from

(1) *Alliance Agricole Belge*, No. 40. Brussels, October, 1, 1938. — (2) *Moniteur Belge*, No. 323, November 19, 1938. — (3) *Moniteur Belge*, No. 251, September 8, 1938. — (4) *Moniteur Belge*, No. 230, August 18, 1938.

117.28 to 64.43 for rye; from 114.73 to 77.40 for oats; from 116.92 to 75.13 for winter barley.

The position is critical because world prices represent only from 50 to 65 per cent. of cost prices, and because about a third of Belgium's farm lands are under these crops.

In accordance with its programme, the Government has therefore decided to proceed with the "valorization" of cereals, which is considered indispensable to agricultural equilibrium; the policy employed from 1932 to 1935 and then abandoned was again introduced in 1938. The funds for valorization are obtained from a tax on import licences. By a Royal Decree of July 19, 1938 imports of wheat were subjected to a special duty of 10 francs per quintal which was first raised to 20 francs (Royal Decree of September 14, 1938) and then to 22 francs (Royal Decree of December 26, 1938) <sup>(1)</sup>. With the exception of oats, which is regulated separately, valorization applies to all cereals, including rye, barley, spelt and meslin.

A special commission consisting of agricultural and industrial representatives, economists and Government officials is to study the cereals problem as a whole.

### Dairy produce.

In recent years the Government has paid special attention to milk. In our last Chronicle dealing with Belgium <sup>(2)</sup> we described the Government's plan for dealing with this question. This plan is now being put into operation.

In recent months the economic position of milk production and the milk industry has not been satisfactory. The price of milk products has fallen; butter from 25.20 francs in March 1938 to 23.50 in April and 21.60 francs in May. It might have been thought that less milk would have been marketed than in the preceding year owing to the epidemic of foot and mouth disease, but this was not in fact so.

Margarine and food fats were strong competitors to butter.

Dairies and merchants helped to ease the market somewhat by withdrawing for winter consumption more than 3 million kilograms of butter during the period of high output.

The Ministry of Agriculture prohibited all imports of butter and limited monthly quotas for manufacturing coloured margarine to a strict minimum.

The "National Office for Milk and its Derivatives" has assumed the supervision of butter, compulsory and optional, which the Ministry decreed on April 30, 1938. It aims at ensuring the production and consumption of a butter guaranteed as to quality. Any dairy or butter factory desiring to use the official mark must have been approved by the Ministry of Agriculture. The milk department of the Ministry prepares a report on the dairy or factory ascertaining in particular whether pasteurization is adequate, whether refrigeration equipment is satisfactory and whether the water can be declared pure after chemical and bacteriological analysis. The actual supervision is carried out under the auspices of the National Office for Milk and is conducted by means of frequent tests and analyses of butter. When several tests have given satisfactory results, the official mark is stamped on the butter of the approved dairy or factory.

On September 24, 1938 a ministerial decree <sup>(3)</sup> dealt with the supervision, compulsory and optional, of condensed milk.

---

<sup>(1)</sup> *Moniteur Belge*, No. 365, December 31, 1938. — <sup>(2)</sup> April 1938 number of this Bulletin. — <sup>(3)</sup> *Moniteur Belge*, No. 230, August 18, 1938.

Further, three royal decrees dated August 13, 1938 <sup>(1)</sup> were issued, which aimed at offsetting seasonal fluctuations in the milk market. The first grants subsidies to manufacturers of whole milk powder, thus enabling 5 million litres of milk to be withdrawn from the market. The second subsidizes the production of condensed milk, allowing from 4 to 5 million litres of milk to be taken from the market. The third subsidizes the production of cheese. All these subsidies are intended to support a new industry which will absorb a large quantity of milk from the market during times of over-production.

The use of the words, butter, cream, milk cheese, is regulated by the Decree of August 13, 1938 <sup>(2)</sup> which attempts to stop the use of trade marks for certain goods which show the names of milk products not really contained in the goods.

### Meat.

*Beef and veal.* — During recent months the position of the beef and veal market has been unsatisfactory, but there is not much scope for intervention in this field. In trade agreements with Denmark and Ireland in 1934, formal arrangements were made for the import of cattle. Improvement in the beef and veal market depends largely upon the possibilities of altering existing agreements. As occasion arises the Government endeavours to adapt these agreements so that cattle-breeding may be protected.

There were negotiations with the Danish Government for a provisional arrangement after imports of cattle into Belgium had been suspended owing to foot-and-mouth disease. On September 22, 1938 a provisional arrangement was signed by which it was agreed that the Belgian Government should concede Denmark a beef quota. Such imports would be sold on the open market in Belgium. Meanwhile it was pointed out to the Belgian stock farmers that home production would soon meet all the needs of the home market and that it should not therefore be increased too much.

*Pigmeat.* — In contrast to beef, the market for pig products was very satisfactory in 1938. A rise in the price of pork followed the low prices of 1937 as was to be expected from the course of the pig cycle. The depression in pig production was lessened by Government measures to encourage exports, the value of exports of fresh pig-meat, salted fat pork and lard to Germany reaching nearly 12 million francs in 1937.

The spread of foot-and-mouth disease affected the cyclical rise in pig prices.

### Agriculture and paid holidays.

A royal decree of July 15, 1938 <sup>(3)</sup> fixed the special methods of applying the law of July 8, 1936 relating to holidays with pay to farm, horticultural and forest workers. These branches of production are regulated as follows:

1. Permanent employees may claim one day's paid holiday for each consecutive month of work with the same employer.
2. The holiday must be taken during the year in which the work is performed; by agreement with the employer the worker may take all or part of his holiday during the first three months of the following year.

---

<sup>(1)</sup> *Moniteur Belge*, No. 292, October 19, 1938. — <sup>(2)</sup> *Moniteur Belge*, No. 230, August 18, 1938.  
— <sup>(3)</sup> *Moniteur Belge*, No. 197, July 16, 1938.

3. For each day's leave the worker is to be paid the daily wage earned at the time of leaving for the holiday, plus the money value of any payments in kind which he may receive.

4. The holiday may be taken in single days at any time during the year, provided that each holiday period of less than two days is preceded or followed by a Sunday or legal holiday.

Holidays dates are arranged by agreement between employer and worker in such a way that work is not impeded.

## HUNGARY <sup>(1)</sup>

### General situation of agriculture.

Recent international events have brought an increase of 12,000 square kilometers to the territory of Hungary. The regained territory is geographically part of the Hungarian basin, and in it—as in the rest of the country—agriculture is the predominant economic activity. To the farm lands of Hungary it has brought an increase of about two million hectares or 12.5 per cent.

The different branches of agricultural production in the regained territory are in approximately the same proportion as in the rest of the country. The area of woodlands is however relatively greater and has brought an increase of 23 per cent. to the woodlands of the country. This means that imports of wood for fuel will be reduced; imports of wood for building purposes will, however, probably increase. There are relatively fewer vineyards and meadowlands in the new territory so that the internal market for wines has been increased to some extent.

As there are considerable differences in the distribution of arable land between the various crops in the new territory, the increases in output vary greatly. Thus the output of wheat has increased by 13 per cent., rye 16 per cent., barley 23 per cent., oats 5.5 per cent., potatoes 19 per cent. and sugar-beet 50 per cent.

In general, the new territory is even more agrarian in character than the rest of the country. In many respects therefore Hungary will have a larger export surplus of agricultural products within the next few years, though the position may change in time. From the point of view of national economy as a whole the changes in the economic structure can be considered with satisfaction, since both the capacity for producing raw materials and also the internal market have increased.

The following chronicle refers to the former area of Hungary, before the recent recovery of territory.

The general economic situation was more favourable in the first six months of 1938-39 than might have been expected from the business prospects of the previous six months. This was due to the exceptionally good harvest and possibilities of export. On August 27 it was estimated (figures in parentheses showing the average for 1931-1935) that 26.2 (20.8) million quintals of wheat, 8.2 (7.2) of rye, 6.7 (6.3) of barley, 2.8 (2.7) of oats, 26.1 (18.6) of maize, 24.3 (16.8) of potatoes and 9.7 (8.9) of sugar-beet were

---

(<sup>1</sup>) Brought up to December 31, 1938.

(<sup>2</sup>) See the *Chronicle* for July 1938.

harvested. But the yield was below the average for other products such as fruit, vegetables and wine. The yield of fruit and vegetables was small, and the harvest was delayed by unfavourable weather at the beginning of the year.

Cattle suffered very badly from foot-and-mouth disease which had, however, begun to abate at the time of this report. A relatively damp summer and the continued mildness of autumn assured good pasture up to the end of October. The autumn weather was throughout quite good and facilitated the carrying-out of farming operations.

Although the harvest was above the average, selling conditions were not unfavourable. The surplus of cereals amounted to 7 million quintals, of which 5 million have already been sold to Germany, Italy and Switzerland, though there were difficulties in marketing rye and barley. On the other hand there was no difficulty in marketing maize and potatoes, and particularly on the home market-wine. Up till the last few weeks exports of pigs were very satisfactory, whereas throughout the whole period covered by this report exports of cattle fell off, chiefly because of the catastrophic fall in the exports to Italy. Exports of eggs and poultry remained somewhat lower than in the previous year. The small surpluses of fruit and vegetables were marketed easily and at fairly good prices.

With the exception of cattle, rye and barley, prices were satisfactory, though home prices for pigs fell in December. The movement of prices and harvest led to a substantial increase in the purchasing power of the farming community, which in October was 21 per cent. above the previous quarter and 33 per cent. above October of the preceding year.

As before, the Government, sought to promote and improve sales of agricultural products. As was shown in the last chronicle <sup>(1)</sup> the financial backing for the marketing scheme consists of a fund derived from different taxes, tariffs and other contributions, and is administered by the Minister of Agriculture. This fund and the marketing scheme which it finances were maintained for 1938-39 <sup>(2)</sup>.

Labourers also benefited from the good harvest as many of them receive payment in kind. The day labourers paid in money were also better off and had more regular employment. Despite the employment of older men there was a temporary shortage of labour in many places. In the autumn a day-wage of 4 or even 5 pengős was paid to male workers. The payment of benefits for the old age insurance scheme introduced in 1938 will commence in 1939.

### Market and price regulation of cereals and oilseeds.

The Government decides from year to year the extent to which futures may be dealt in on the exchange. As before, farmers were opposed to it in 1938-39 while business circles supported it and demanded the reintroduction of dealings in wheat futures. The Government kept to its former position, allowing dealings in rye and maize futures, but refusing to reintroduce dealings in wheat futures.

---

<sup>(1)</sup> See the Chronicle for July 1938, *Monthly Bulletin of Agricultural Economics and Sociology*, p. 332 et seq.

<sup>(2)</sup> Government Decree (No. 4 300, M. E. 1938) to continue measures in support of agriculture: *Budapesti Zörlöny*, No. 142, June 29, 1938.

The Ministry of Industry and Trade authorized the *Futura A. G.*, the official organization of this Ministry, which regulates the sale of cereals, wool, etc., to buy and work up sunflower seed and to sell sunflower oil. The prices of seed and oil were fixed for the whole year. Importers could obtain permits to import foreign fats only if they agreed to take a certain quantity of oil from the *Futura* at a fixed price, or else to pay into the fund for subsidizing exports a certain contribution for each quintal of fat imported. Neither permits for the import of fats nor export bonuses were granted for seed and oil not bought through the medium of the *Futura*.

### Introduction of an Alcohol Monopoly.

In the last half year, the most important legislative measure relating to agriculture was the Alcohol Monopoly Law <sup>(1)</sup>.

Previously there had been an excise duty on alcohol and the total annual output was fixed, being divided between agricultural and industrial distilleries in the proportion of two to one. The aim of the new law is to control marketing more strictly and to shift production in favour of agriculture in general and of peasant farms in particular. The industrial distilleries either become the property of the State or continue to work for the account of the State. Large distilleries must be taken over by the State, but the operation of the smaller ones is left to the discretion of the Government. No new industrial distilleries will be allowed. In the case of agricultural distilleries the law distinguishes between private and co-operative. The latter are intended to supplement the small farms, as the private distilleries do the larger farms. Distilleries for wine and fruit form a separate group. The Government can order them to manufacture a certain percentage of their quota of spirits exclusively from wine, and to buy the wine directly from the producer at a fixed price so long as this price does not rise above certain level. In contrast to the above group, which includes the large enterprises, the small distilleries for fruit brandies are designated by the law as brandy distilleries. In these the raw materials produced on the small farms are distilled against payment in money or with part of the product. Agricultural interests are also to receive more consideration as regards refining, industrial distilleries receiving in future no licences for refining, while the agricultural distilleries may receive licences only when they are attached to a co-operative organization.

Every year at least 4 distilleries will be authorized, in the first place for farmers' co-operative organizations. If the quotas are not increased to correspond with the capacity of the new distilleries they may be re-distributed in favour of the cooperative distilleries.

The State can also distil on its own account in the so-called monopoly distilleries, and it alone has the right of importing and resale. The State also fixes the sale prices to be paid to the distilleries, graded with reference to the type of enterprise, capacity and quota, the principle being that an adequate profit should remain after total costs have been covered. The designation of a distillery as "agricultural" depends upon conformity with certain conditions. It is forbidden to lease agricultural distilleries and their location can only be shifted with special permission and under specified conditions.

---

<sup>(1)</sup> Law. A. XXX, 1938, published in the *Országos Törvénytar* of July 22, 1938. Order published in the *Budapesti Közlöny* No. 185 of August 20, 1938.

### Regulation of wool marketing.

Instructions from the Ministry of Agriculture to the *Futura A. G.* mentioned above regulate the marketing of wool as follows:— the farmer delivers the wool to a prescribed warehouse where it is immediately graded. The estimated price is at once published by the *Futura*. If the producer desires to dispose of the wool at this price, he receives the purchase price immediately with a deduction of only one per cent. commission. If he wishes to postpone sale to some future, he must bear the costs of warehousing and insurance in addition to that of the commission. The farmer may also sell freely without the *Futura*, but he must then pay the commission and the costs of transfer and warehousing. Finally, the farmer may also sell the wool at the first auction, independently of the estimated price published. The system is therefore elastic, and if appears to satisfy the producer.

### Regulation of trade in fuel wood.

The Government has freed trade in fuel wood from all the former restrictions, so that the powers of the Government commissioner, transport permits, and fixed prices are abolished for the year 1938-39. But to make supervision possible, wood dealers must inform the Office for Foreign Trade of all sales contracts for more than 10 metric tons <sup>(1)</sup>.

### Regulation of wine and fruit production.

The law <sup>(2)</sup> on the "vine communes", and the cultivation of wine and fruit, recapitulates the existing legislation on the wine industry, but in many respects its production policy for this very important branch of Hungary's industry strikes out in quite new directions. Compulsory unions of wine-growers under the name of "vine communes" have existed for decades, but their means were too small and their powers too limited. The new law orders that henceforth in every political commune where there are not less than five owners of vineyards with not less than fifty cadestral *joch* <sup>(3)</sup> of vinelands, the owners must form themselves into "vine communes"; similarly for orchards. In this way such organizations will be formed in approximately every third commune, to protect plants against disease, and to promote rational methods of planting, cultivation, harvesting and marketing. To cover costs they are allowed to exact contributions similar to public taxes. The "vine communes" are grouped like "Comitats" into so called "councils of the vine communes" which must regulate the work of the separate communes for purposes of production and marketing. They also

---

<sup>(1)</sup> Order (No. 5920 M., E. 1938) on giving information about contracts in fuel wood. Published in the *Budapesti Közlöny* No. 188 of August 25 1938.

<sup>(2)</sup> Law on the vine communes and wine and fruit cultivation. Published in the *Országos Törvénytár* of August 2, 1938.

<sup>(3)</sup> *Joch* = 1  $\frac{1}{4}$  English acres approximately.

serve as executive organizations for the Minister of Agriculture as regards wine and fruit. The work is looked after by the secretary of the council, who must have had specialised training in the subject.

The second part of the law contains regulations for wine and fruit production. The law forbids the planting of new vineyards for three years. When this prohibition—which in certain cases may be extended for a further three years—lapses, planting is only allowed on suitable sandy soil or on suitable mountain land. In any case, no one owner may plant more than two *joch*, and the total may not exceed 2000 *joch* in any one year. Moreover, newly planted areas have to pay special taxes. Existing vineyards situated on flat land and causing serious marketing difficulties with their ordinary wines must pay a fairly high tax, which is used to subsidize marketing. By this means it is hoped to reduce the area of surplus cultivation and to convert it into arable land. The law has also solved the problem of direct bearing plants by ordering their destruction or top-grafting, though in such cases compensation or a money subsidy from the State is to be paid. No compensation will be paid to vineyards of this type exceeding two *joch* unless the vine is the principal plant grown on the holding in question.

The law gives full powers for the future regulation of vine-growing by means of Orders. Varieties of wine and table grapes have been fixed for the various vine-growing regions <sup>(1)</sup>. In selecting table grapes, the needs of foreign markets have been given careful consideration. Various other measures protect vine-growers against trade abuses. The cultivation of and trade in vines is strictly supervised and the seller is made responsible for the purity, uniformity and quality of the different varieties.

These measures give the Government the power of controlling production and sale and so also of removing marketing difficulties. Vine-growing is important in Hungary not only for economic but also for social reasons, since more than 100,000 agricultural workers live by it. Marketing difficulties are mainly a result of the dependence upon exports, which again is due to the relatively small *per capita* consumption of grapes (2.7 kg.) and wine (37.9 litres). In some years all difficulties in marketing an average harvest would disappear with an increased consumption of 10 litres per head per annum. For this reason the order sets up several selling organizations to increase the consumption of wine.

Finally the law requires owners of vineyards of more than a certain size to appoint administrators with specialised secondary or higher education. The same duty falls upon owners of orchards.

### Regulation of fruit exports.

The Office for Foreign Trade regulates exports of fruit and seasonal products as follows. Exportation proceeds under supervision, and exports to the chief importing countries may only take place through the "Hungarian Union for Fruit Exports" which is to be set up. Only those exporters may join the Union who agree always to pay the producer export-quality prices. They must not undersell on foreign market and must attend to the standards of quality and help to improve quality by all methods.

---

<sup>(1)</sup> Order (No. 85,000, 1938 F. M.) on the application of the law regarding vine communes. Published in No. 243 of the *Budapesti Közlöny* of October 30, 1938.

A further obligation is a minimum export. The Office of the Union supervises the fulfillment of these obligations. Export quotas are not allotted within the Union.

These have been certain new regulations regarding the export quality of peaches, apricots and table grapes <sup>(1)</sup>.

### Agricultural credit.

Formerly the Statutes of the Bank of Issue only permitted the discounting of bills with a maximum maturity of six months. The Statutes as modified distinguish between agricultural commodity bills and agricultural production bills. Commodity bills are for based on deliveries of goods and other supplies occurring in the normal course of farming operations. On the other hand production bills, which can run for nine months, are based on the farmer's credit operations for obtaining money needed to cover the cost of the production process or production period. The Bank of Issue only discounts production bills if the financing institute presenting the bill declares that the credit was granted for purposes of production and that the debtor is known as a solvent and capable farmer. This is done by means of form which in some cases, is also confirmed by the Chamber of Agriculture. At present this type of bill does not exist in any other country. The stamp duty on bills has been reduced from 5 to 2 per cent. as a further aid to seasonal credits for agriculture <sup>(2)</sup>.

### Other measures.

To put the different measures aiming at the supervision of the *cereals* market on a sound basis, the Government made the opening of new mills and the extension of existing ones dependent upon the consent of the Minister of Industry <sup>(3)</sup>.

A further ordinance <sup>(4)</sup> empowered the Minister of Agriculture to order the *eradication of maggot and similar pests from lentil, pea and vetch* crops in all communes in which, or near which, the State, a public body, or an agricultural union, operates an establishment for the eradication of such pests. When such an order is issued producers are required to report the area cultivated and the size of the crop, while the introduction of the above named crops into the area in question is forbidden. The products named may be put on the market in the districts mentioned only after the eradication process has been carried out and only in specially marked sacks.

---

<sup>(1)</sup> Order (No. 5670, 1938, M. E.) on the supervision and testing of quality of table grapes intended for export. Published in the *Budapesti Közlöny* No. 180 of August 13, 1938. — Order (No. 6130, 1938, M. E.) on the supervision of exports of peaches and apricots. Published in the *Budapesti Közlöny* No. 194 of September 1, 1938. — Order (No. 93420) on the supervision of exports of certain varieties of table grapes. Published in No. 213 of the *Budapesti Közlöny* of September 24, 1938.

<sup>(2)</sup> Order (No. 1509, 1938, P. M.) on the duties on agricultural bills. Published in the *Budapesti Közlöny* No. 142 of June 29, 1938.

<sup>(3)</sup> Order (No. 4450, 1938, M. E.) on limiting the building or extension of mills. Published in the *Budapesti Közlöny* No. 226 of October 11, 1938.

<sup>(4)</sup> Order (No. 106, 153, 1938, F. M.) on the compulsory protective measures against corn-weevil in lentils, peas and vetch. Published in the *Budapesti Közlöny*, No. 138 of June 24, 1938.

Previously the State had encouraged the *cultivation of silkworms* among the rural population, and at the same time had set up silk mills. After the War these were leased out, but in recent years the Ministry of Agriculture has brought them back under State control. In this way it is hoped to increase exports.

By an Order <sup>(1)</sup> of December 1938 on the *compulsory leasing of neglected landholdings* the Minister of Agriculture can order owners of property which has remained uncultivated in part or in whole for one year to attend to its cultivation or else to lease the property either in whole or in part, within a prescribed time. If the land has been neglected for more than two years the Minister does not need to give the owner the first of these two alternatives. Such lands may only be leased to small tenants.

To improve the cultivation of cereals 6,000 metric tons of seed wheat and 2,000 metric tons of seed rye were distributed, the State paying the price difference and transports costs. Thus the farmers had to pay only the normal price of the grain.

The *scarcity of manure* remains a great obstacle to agriculture in Hungary. The consumption of artificial manures specially low on the smaller farms. The Government has therefore taken several measures to encourage and facilitate its consumption.

A two-year *course on horticulture* has been arranged in the Faculty of Agriculture of the University for Technical and Economic Sciences. Previously there was only a secondary technical school for horticulture.

## IRELAND

The general position of Irish agriculture in recent months has been characterised by the continued increase in the value of agricultural exports. This is of special importance as about half of the total value of annual agricultural output is represented by exported produce. The value of annual agriculture exports rose from £13,934,000 in 1935 to £16,437,000 in 1936 to £16,938,000 in 1937; and the value for the eleven months January to November 1938 was £17,476,000 that is greater than that for the whole year 1937. There have been considerable increases in each of the four most important individual items.

*Value of Exports of Irish Agricultural Produce.*

	January-June		January-November	
	1938	1937	1938	1937
	£	£	£	£
Total . . . . .	7,780,130	7,069,183	17,476,320	14,334,899
Cattle . . . . .	3,853,993	3,467,252	8,870,745	7,018,258
Bacon and ham . . . . .	876,892	743,824	2,062,248	1,595,797
Butter . . . . .	741,396	570,924	2,122,804	1,549,962
Eggs . . . . .	780,284	619,654	1,159,438	853,007

<sup>(1)</sup> Order (No. 8730, 1938, M. E.). Published in the *Budapesti Közlöny* No. 271 of December 2, 1938.

From these figures it can be seen that the increase that has been going on in recent years was intensified in the second half of 1938, mainly by a very large increase in the value of cattle exports. Cattle exports account for about half of the total value of Irish agriculture exports.

This increase in the total value of agricultural exports is due mainly to a rise in prices obtained on export markets. An index of exports prices (1930 = 100) rose from 61.7 in 1935 to 66.6 in 1936 and to 74.9 in 1937; in January 1938 it stood at 81.2, rose suddenly in May and June to 89.5 and 95.0 respectively and was 89.8 in September 1938, the latest figure available.

In contrast with exports of agricultural produce, exports of industrial goods were less in value in January-November 1938 than in the corresponding period of 1937. Further, the much more important item, imports of industrial goods, was also smaller in this period of 1938 than in the same period of 1937; the figure for 1938 is £25,521,035, for 1937, £28,115,612 <sup>(1)</sup>.

This, and the fact that the number of unemployed has been greater in recent months than it was in the corresponding period of 1937, point to a deterioration of the general economic situation.

Agricultural prices have been, however, considerably higher in 1937 than they were in the preceding year.

*Agricultural Price Index Numbers.*

(Base 1911-13 = 100).

	1936	1937	1938
January. . . . .	83.4	92.1	104.1
February . . . . .	82.1	93.8	107.4
March . . . . .	82.8	98.6	108.3
April . . . . .	86.0	103.6	108.5
May . . . . .	90.0	106.5	111.5
June . . . . .	90.8	107.9	114.5
July . . . . .	90.7	110.5	112.1
August . . . . .	92.2	106.9	111.4
September . . . . .	91.8	106.3	114.1
October . . . . .	98.1	110.4	116.3
November . . . . .	95.7	106.9	...
December. . . . .	98.9	108.3	...

The prices of the most important individual products of Irish agriculture have been higher in 1938 than in 1937. Cattle accounted for nearly twenty per cent. of the total value of agricultural output in 1936-37, and are by far the most important indi-

<sup>(1)</sup> The adverse balance of trade of the twelve months December 1937 to November 1938, £17,609,900, was about £3,400,000 less than in the corresponding period 1936-37 but the same approximately as in the same period of 1935-36 and 1934-35.

vidual product. The prices of cattle on the Dublin market averaged 21.25s. per cwt. in 1935, 23s. in 1936, and 29.5s. in 1937; and during 1938 this rise has continued. From 33s. in January the price rose to a 38s. in June. It then fell to 31.5s. in October, the latest figure available; this fall is, however, a seasonal movement, the prices realised in the autumn of 1938 being the highest autumn prices since 1932.

The prices of pigs and of butter, two other of the most important provides, are subject to government regulation. Pigs prices were at about last years's level <sup>(1)</sup>. Butter prices, on the other hand, were considerably higher <sup>(2)</sup>.

Certain agricultural costs have risen. Particularly is this the case with feeding-stuffs. The prices of maize, maize-meal, linseed cake and meal were higher in the third quarter of 1938 than in the same period in 1937. Cotton-seed cake, and certain other feeding stuffs were, on the other hand, cheaper.

There has been no important change in Government agricultural policy in recent months. However, in November 1938 the Government agreed to a request from a deputy in the Dail for the appointment of a Commission to enquire into the conditions of Irish agriculture.

### Foreign trade regulations.

*Trade Agreement with Germany.* — The Trade Agreement signed in January 1935 was, in November 1938 extended for a further period of twelve months beginning on January 1, 1939. Arrangements have been made for the export to Germany in 1939 of cattle, eggs, meat products, and herrings. The new agreement provides that German purchases in 1939 will be made on the open market; this obviates the necessity for special price arrangements between the Governments.

The total value exports to Germany has increased considerably since 1934; but this total still remain but a very small percentage of total Irish exports. Exports to Germany in the years 1934 to 1937 valued £ 163,828, £ 493,982, £ 640,102; and £ 840,492 <sup>(3)</sup>. The total value of Irish exports in 1937 was about £ 22,000,000.

### Cereals.

Cereal-growing in Ireland is encouraged by various measures taken in accordance with the Agricultural Produce (Cereals) Acts, 1933-35.

*Wheat.* — The wheat-grower is guaranteed a statutory minimum price and is assured a market for his produce.

The statutory minimum prices are fixed two years in advance and have already been fixed for the crops of the 1939-40 and 1940-41 seasons. Four official grades of wheat based on bushel weight are established and prices for each grade are fixed for each month of the year. These statutory minimum prices are to be the same in 1939-40 and 1940-41 as they were in the two preceding seasons.

---

<sup>(1)</sup> See page 83.

<sup>(2)</sup> See page 83.

<sup>(3)</sup> The figure for Austria rose from £ 1,299 to £ 2,045, an insignificant amount.

In addition to this statutory regulation, wheat prices are regulated by agreement between the Irish Beet Grower's Association and the Irish Flour Millers Association. An agreement reached in September 1938 fixed minimum prices considerably higher than the statutory minimum; these prices are the same as those agreed upon last year except that a new fourth grade, not corresponding to an official grade, is introduced and the price for this grade is fixed 1s. higher than the fifth grade in which wheat now coming into the fourth grade previously fell.

*Prices for Home-Grown Wheat for Crops of the 1939-40 and 1940-41 Seasons.*

(a) *Statutory minimum prices.*

Prices per barrel of 20 stones.

Grade, according to bushel weight	September- November	December	January- February	March-July	August
1. - Not less than 62 lb. . . . .	27s.	27s. 6d.	28s.	28s. 6d.	27s.
2. - Less than 62 but not less than 59 lb. . . . .	26s. 6d.	27s.	27s. 6d.	28s.	26s. 6d.
3. - Less than 59 but not less than 56 lb. . . . .	26s.	26s. 6d.	27s.	27s. 6d.	26s.
4. - Less than 56 but not less than 53 lb. . . . .	24s.	24s. 6d.	25s.	25s. 6d.	24s.

(b) *Minimum prices fixed by agreement between  
the Beet Growers Association and Millers Association.*

Prices per barrel of 20 stones.

1. - Not less than 62 lb. . . . . 30s. 6d.
2. - Less than 62 but not less than 59 lb. . . . . 30s. 0d.
3. - Less than 59 but not less than 56 lb. . . . . 29s. 6d.
4. - Less than 56 but not less than 55 lb. . . . . 28s. 6d.
5. - Less than 55 but not less than 53 lb. . . . . 27s. 6d.

In order to ensure that all the wheat harvested shall be absorbed by the mills, the Acts provide that of the quota of wheat to be milled allotted to each registered miller for each season, a percentage to be fixed for each season by the Minister for Agriculture, shall be home-grown wheat. For the 1938-39 season this percentage was fixed at 35 <sup>(1)</sup>; but by a Variation in Order <sup>(2)</sup> made in October 1938, it was reduced to 30.

<sup>(1)</sup> See the September 1938 issue of this Chronicle p. 446.

<sup>(2)</sup> Home-grown Wheat (National Percentage for Cereal Year, 1938-39) (Variation) Order, 1938.

*Maize.* — A further provision of these Acts is that all maize meal mixture shall contain a certain percentage by weight of home-grown cereals. This percentage has been fixed from time to time by the Minister for Agriculture; since August 1, 1938 it has been 10 per cent. <sup>(1)</sup>.

This provision was intended to ensure a ready market and reasonable prices for home-grown barley and oats. The main object of the Acts was, however, to encourage wheat-growing, and now that the area sown to wheat has increased from less than 22,000 acres in 1932 to over 220,000 in each of the last three years and has become an important source of receipts from arable-farming, the need to grow oats and barley as a cash crop is smaller than it was. Although it has been necessary to fix only a low compulsory admixture percentage in order to absorb the surplus of saleable barley and oats in recent years, the maize-mixture regulations have been detrimental to the interests of stock-breeders because they have tended firstly to make the price of maize-meal higher than it otherwise would have been, and secondly to restrict the freedom of choice of feeding-stuffs. In these circumstances the Minister for Agriculture has announced that in September 1939 the maize-mixing scheme will be abolished.

### Regulation of the price of bread.

Bread prices in Ireland are regulated in accordance with the *Bread (Regulation of Prices) Act, 1936*. This Act empowers the Minister for Industry and Commerce to fix a standard price for flour; this is not a price to be adhered to by millers and the public in actual sales nor a statutory maximum or minimum, but serves solely for the calculation from a schedule set up in accordance with the Act, of a minimum retail price for bread. In June 1938 the standard price of flour was 48s. 6d. per sack of 280 lb., and this gave a retail price of bread of 11½d. per 4 lb. loaf. Since then two changes have been made; the first by an Order issue at the end of August which reduced the standard price of flour to 46s. per sack, and then by an Order made at the end of October which further reduced it to 41s. 6d. per sack. This latter price gives a minimum retail price for bread of 10½d. per loaf, 1d. per loaf less than the June price.

### Milk.

*The regulation of the supply and price of milk* is provided for by an Act passed in 1936. This gives the Minister for Agriculture power to set up Milk Boards, representing producers and distributors to control the milk market in any districts designated for this purpose. On the recommendation of a Milk Board the Minister of Agriculture may establish statutory minimum wholesale prices for milk in the district over which the Board has control. The following prices to be paid by registered *wholesalers* were accordingly fixed by Orders issued by the Minister for Agriculture.

The prices payable by registered *retailers* for milk bought directly from registered producers are 2d. per gallon higher in the Dublin District, but in the Cork District, where in the period October 1, 1937 to April 30, 1938 they were 1d. per gallon higher, they are now the same as those payable by registered wholesalers.

---

<sup>(1)</sup> See the September 1938 issue of this Chronicle. p. 446.

In the Dublin District the unweighted average price for 1938-39 is almost 1d. per gallon higher than that for 1937-38; in the Cork District the average is only  $\frac{1}{6}$ th of a penny higher (†).

*Minimum Prices to be paid to Registered Milk-Producers.*

For each gallon of milk delivered at the premises of the producer to registered-wholesalers.

	May-July	August	September	October-April
<i>Dublin District:</i>				
1937-38 . . . . .	8 $\frac{1}{2}$ d.	8 $\frac{1}{2}$ d.	1s. 0 $\frac{1}{2}$ d.	1s. 0 $\frac{1}{2}$ d.
1938-39 . . . . .	8d.	10d.	10d.	1s. 2 $\frac{1}{2}$ d.

	May-August	September	October	November-March	April
<i>Cork District:</i>					
1937-38 . . . . .	8 $\frac{1}{2}$ d.	8 $\frac{1}{2}$ d.	1s. 0 $\frac{1}{2}$ d.	1s. 0 $\frac{1}{2}$ d.	1s. 0 $\frac{1}{2}$ d.
1938-39 . . . . .	8 $\frac{1}{2}$ d.	11 $\frac{1}{2}$ d.	11 $\frac{1}{2}$ d.	1s. 0 $\frac{1}{2}$ d.	...

	May-July	August-September	October-April
<i>Leinster District:</i>			
1938-39 . . . . .	8d.	10d.	1s. 4 $\frac{1}{2}$ d.

The funds required to cover the expenses of these boards are obtained by means of a levy on milk producers, wholesalers and retailers. In 1937 this levy made was by both the Cork and the Dublin Boards at the rate of  $\frac{1}{4}$ d. per gallon. In September 1938 the Dublin Board reduced its levy to  $\frac{1}{4}$ d. per gallon; the levy imposed by the Cork Board remains at the old rate.

### Dairy produce.

The Dairy Produce (Price Stabilisation) Act, 1935 provided for bounties to be paid on exported dairy produce, with the object of stabilising the prices received by the producer. Funds for this purpose are provided by a levy on the sales of the products concerned. This system was in continuous operation till the autumn and winter of 1937 when the improvement in the external market led to a suspension of both bounties and levy.

Note: The coming into force of the milk "special designations regulations" described in the September, 1938 issue of this Chronicle p. 443 has been postponed till April 1939.

(†) Assuming that the price of 1s. 0  $\frac{1}{2}$ d. per gallon be established for April, 1939.

In the summer of 1938 new bounties and levies were introduced and the rates of these have since been increased. The latest changes were made by orders coming into effect of September 1, 1938 which made the following changes:—

*Creamery Butter.* — The bounty on creamery butter has been increased by 10s. per cwt. over the rates previously in force <sup>(1)</sup>.

An Order, coming into force of June 1, 1938, exempted from the levy fixed on May 1, 1938 at 6s. per cwt. on all sales of creamery butter established, all creamery butter put into cold store before September 17, 1938 <sup>(2)</sup>.

*Cheese.* — The bounty remains at the rate fixed in May 1938, i.e. 5s. per cwt. and the rate of levy, at 5s. per cwt. on raw cheese and 7s. per cwt. on processed cheese.

In addition to these measures the Government has since April 1938 guaranteed to creameries a given return on their butter sales, a return independent of the price obtained on the export market. An Order <sup>(3)</sup> made in December 1938 fixed the guaranteed minimum price at 147s. per cwt.; this is an increase of 9s. per cwt. over the price previously guaranteed <sup>(4)</sup>.

### Pigs and bacon.

The supply and prices of bacon pigs and bacon in Ireland are regulated by the Pigs Marketing Board and the Bacon Marketing Board set up under the Pigs and Bacon Acts, 1935-1937. The Pigs Marketing Board has power to fix, and regularly fixes, two prices, an "appointed" price which is an actual price for pigs and carcasses of pigs sold to factories or otherwise, and a "hypothetical" price, which is the price the Board considers "would under normal conditions be the proper price thereof". Should the hypothetical exceed the appointed price each licensee or registered minor curer has to pay the Board a levy calculated on the basis of the price difference. The money so received by the Board is used to make payments to licensees or minor registered curers when appointed prices exceed hypothetical prices.

Both the "appointed" prices and the hypothetical fixed during the second half of 1938 show general decreases. Appointed prices were from 3 to 8s. per cwt., according to the grade, lower in November than in May; the prices fixed in the middle of December were, however, 1 to 2s. per cwt. higher than those fixed in November. "Hypothetical" prices were lower in November than they were in July by from 4 to 11s. per cwt., according to grade, but they also were higher in December by 1 to 2s. per cwt.

<sup>(1)</sup> Bounty on creamery butter "delivered in Eire and on which a levy at the appropriate rate has been paid", 20s. per cwt., on creamery butter "approved within the rules relating to the marketing of butter made by the Minister of Agriculture in 1937", and exported, 14s. per cwt on creamery butter "not approved" and exported 11s. per cwt. See the September, 1938 number of this Chronicle p. 444.

<sup>(2)</sup> See the September, 1938 number of this Chronicle p. 444.

<sup>(3)</sup> Creamery Butter (Minimum Prices) (No 3) Order, 1938.

<sup>(4)</sup> See the September 1938 issue of this Chronicle p. 444. The price quoted is for lots of not less than 20 cwts; for smaller lots the price is 151s. per cwt.

The appointed prices have remained considerably below the hypothetical prices, and Orders have been made fixing the levies to be paid by licensed bacon curers, during the first half of 1939. The levy to be paid to the Bacon Marketing Board is to be at the rate of 4*d.* per carcass used; that payable to the Pigs Marketing Board, which had during the 1938 been at the rate of 4*d.* per carcass, is in the first half of 1939 to be 1*d.* per carcass.

The principal function of the Bacon Marketing Board is to control the quantity of bacon produced and of sales on the home-market. For this purpose the Board issues monthly "Production Orders" and "Home-Sales Orders." The quantities established for the months July-September 1938 were higher than those for the corresponding months of 1937. The considerable increase in production quotas has been absorbed mainly by the home-market, the export quotas for this period established by the Minister for Agriculture being only slightly higher than those for the same period of 1937.

*Bacon Production, Home-Sales and Export Quotas.*

(Hundredweight).

	Production		Home-Sales		Export Quotas	
	1937	1938	1937	1938	1937	1938
1st quarter . . . . .	211,500	210,500	103,000	105,000	121,710	121,755
2nd quarter . . . . .	216,000	206,000	111,900	116,000	110,978	123,049
3rd quarter . . . . .	258,000	299,000	122,000	140,000	144,211	149,810
4th quarter . . . . .	252,000	266,000	131,000	149,000	145,575	...
Total . . .	937,500	981,500	467,900	510,000	531,474	...

Prices for bacon on the external market have in recent months been considerably below the home-price. The import of bacon otherwise than under licence is prohibited; an order issue in May 1938 <sup>(1)</sup> gave the Minister for Agriculture the power to attach very strict conditions of control to bacon import licences.

### Sugar-beet.

The prices to be paid for sugar-beet in Ireland are fixed each year by negotiation between the Irish Sugar-Beet Growers Association and the Irish Sugar Company, a monopoly company on the Board of which are a number of Government-appointed directors. Failing agreement the prices are fixed by an independent arbitrator.

The 1938 prices were fixed by arbitration, and lengthy negotiations have so far led to no agreement on prices for 1939.

<sup>(1)</sup> Bacon (Regulation of Import) Order, 1938.

### Livestock improvement.

*Cattle-breeding Scheme.* — The scheme is to be continued in 1939 on the same basis as in 1938. The regional Committees of Agriculture give financial assistance to farmers and others for the purchase and maintenance of bulls of high quality and the services of high quality bulls are made available at greatly reduced rates. The Cork Country Committee of Agriculture decided in January 1939 to increase the premium it will pay to each applicant selected for the purchase of a "premium bull" from £10 to £12.

### Minimum agricultural wages.

The Agricultural Wages Board set up under the Agricultural Wages Act, 1936 made an Order in January fixing statutory minimum rates of wages payable to agricultural workers after the end of January. No change is made in the rates fixed in May 1938 for adult workers <sup>(1)</sup>. Junior workers between 16 and 18 years have however now been divided into two classes and separate minimum rates fixed for each class. Workers under 18 but not under 17 have now to be paid a minimum of 18s. per week of 54 hours, to be compared with 16s. 6d. for workers in the class, under 17 but not under 16, in which they were previously included <sup>(2)</sup>.

## ECONOMIC BIBLIOGRAPHY

A. SERPIERI: *Principii di economia politica corporativa*. Firenze, Soc. An. G. Barbera, 1938-XVII.

There have been many books of a didactic nature in Italy concerned with the economic and social doctrines of corporatism, some of which are of very great value. Among these Professor Serpieri's new book takes an exceedingly high place. It was written primarily as a text book and, while being an independent treatise on general theory forms an introduction to a course of agricultural economics by the same author which, to the great satisfaction of all students of this science, is to be published shortly.

A need is felt among economists for a carefully formulated exposé of the principles of corporative economics, given its rightful place in a logical system, and fitted without prejudice into the general trend of economic thought. This need is now filled by Serpieri's work, which is therefore destined to have a much wider importance than that of an ordinary text-book.

The author's well-known gifts — acuteness of vision, sure intellectual judgement and power of synthesis, not to mention his thorough training — are all revealed in this volume. In addition to an ordered and lucid exposition, the book offers a large number of original points of view, while some subjects are treated with a freshness of approach which is very effective. As an example, we may cite the chapter devoted to the process

<sup>(1)</sup> See the September issue of the Chronicle p. 348.

<sup>(2)</sup> Considerably higher minimum rates are fixed for certain specified areas.

of production in an exchange economy, where — avoiding the hackneyed generalizations of many of the text books and treatises — a comprehensive view is taken of the mechanism and interplay of forces and factors in this process.

In spite of the frequent and superficial criticisms of the general theory of economic equilibrium, the author has, in our opinion, made a particularly felicitous and successful attempt to put this theory in its rightful place in contemporary economic thought.

In the last chapter of the book the fundamental nature of corporatism is examined and the fitted in with the general theory of production and economic choice. In the light of this the author considers the main practical experiments of Fascist economic policy, such as the back-to-the-land movement, the wheat campaign, land settlement and reclamation, and autarchy.

### CROP INSURANCE IN THE UNITED STATES OF AMERICA

CONTENTS:— Attempts at private insurance. — Report of the Committee of 1936. — Law of 1938.

Insurance against crop damage resulting from adverse natural conditions is of quite recent origin, and until lately has been very little developed. It is proposed in this article to give some account of its organisation and progress in the United States of America <sup>(1)</sup>.

#### Attempts at private insurance.

The first attempt at insuring crops against damage from adverse natural conditions was made by a private company at Minneapolis in 1899; previously hail and fire insurance were the only forms of crops coverage existing in the United States.

Between 1917 and 1921 certain fire insurance companies introduced three different types of insurances.

The first, which was offered in 1917 in the States of North Dakota, South Dakota and Montana, covered all the risks to which crops are liable with the exception of fire, floods, frost and want of proper care in cultivation <sup>(2)</sup>.

The amount of insurance was fixed at 7 dollars per acre under wheat, flax, rye, oats, barley and spelt.

It has been noted <sup>(3)</sup> that this method, by which it is a very simple matter to determine the amount of insurance, could not be applied as it stands to a wide range of crops in different parts of the country varying greatly in yields, without either underinsuring certain risks or overinsuring others.

In the case of total crop failure, the company undertook to pay in full the amount of the insurance; in the event of partial loss, the compensation paid was equal to the difference between the policy value and the value of the crop harvested on the area insured, this latter value being estimated at the prices stipulated in the policy.

The companies operating this form of insurance could only to a limited extent fulfil their engagements, owing in part to severe droughts over large areas of the

---

<sup>(1)</sup> Hail insurance was dealt with in an article which appeared in this *Bulletin* of April 1934.

<sup>(2)</sup> The following information on the three forms of insurance policies has been taken from the important study of VALGREN, V. N.: "Crop Insurance: Risks, Losses and Principles of Protection". *U. S. Dept. of Agriculture Bulletin*, No. 1043.

<sup>(3)</sup> VALGREN, in the above study.

States concerned, in part to inadequate safeguards taken by the companies, and also to other causes.

The second form of insurance was introduced in 1920. This type of policy insured the farmer against all crop risks other than fire, hail, wind, tornado, failure of seed to germinate, or want of proper care at the time of sowing, cultivation or harvesting.

The amount of insurance to the acre was determined according to an estimated expenditure for each separate process involved in crop production, with an additional allowance for seed and for rental value of the land.

It as been pointed out <sup>(1)</sup> however that this method, by which the amount of insurance is established on the basis of factors comparatively easy to determine, has the defect that it does not readily lend itself to a differentiation between good and poor farming.

In the event of total destruction of the insured crop, the amount of insurance was paid in full. In the case of partial loss, the compensation given by the company was as before equal to the difference between the policy value and the value of the crop harvested. This latter value was not however fixed in advance as in the first type of insurance, but on the basis of market prices at the time of adjustment. This form of insurance therefore gave protection to the farmer not only against crop damage but also against a fall in prices of the products insured. The consequences of a very heavy drop in prices had to be met by the insuring company.

The third form of crop insurance, introduced in 1921, covered the same risks as the type just examined.

The amount of insurance per acre was established according to a certain percentage of the average yield obtained by the policy holder during the past five years, such percentage being calculated in dollars on the basis of the prices ruling during that period.

This method, it is said <sup>(1)</sup>, has the merit of determining as accurately as possible past results, which undoubtedly form the most reliable basis for the required estimate of future results. On the other hand it is by no means easy to apply; few farmers keep records of yields from year to year and a large proportion of tenant farmers have not worked the farms they occupy long enough to compute a reliable average yield.

With this form of crop insurance the company undertook, in the event of total loss, to pay 75 per cent. of the cost of the field operations actually carried out at the date of the damage. Such compensation was not however to exceed 75 per cent. of the total insurance carried, nor the cost of replacing the whole or any part of the average harvest with products of similar kind and good quality, nor finally to exceed the margin, if any, between the market value of the crop actually harvested and the amount insured. Under this last provision the company was enabled to take advantage of price variations of the products in either direction.

---

<sup>(1)</sup> VALGREN, *Op. cit.*

In 1921 and subsequent years some companies continued to offer crop insurance, most of which however was on fruit and market garden produce; the amounts insured dwindled to very small proportions.

A small company in Kansas undertook in 1930 field crop insurance, insuring the farmer against crop damage and also against price falls; it had heavy losses owing to a severe drop in prices.

In short, the insurance companies failed in their attempts to organise crop insurance in the United States. The following were the main reasons for their failure: the limited area over which insurance was operated, with consequent limited spread of risks; inadequate data for establishing a proper actuarial basis, and finally the attempts to insure the farmer's income rather than the yield losses alone <sup>(1)</sup>.

### Report of the Committee of 1936.

The subject of crop insurance was in consequence constantly before Congress and under consideration by the Department of Agriculture.

The assumption by the Government of far-reaching obligations on account of droughts and other disasters affecting crop production seemed to point the way to the desirability of Government action in planning crop insurance on a scale that would extend the risks over areas so large that a local crop failure would not involve failure of the whole scheme.

At the present time data are available enabling the nature of any crop insurance and advantage may be taken of the results of previous experience <sup>(2)</sup>.

In September 1936 the President of the United States appointed a Committee under the chairmanship of the Secretary of Agriculture for the purpose of preparing a scheme of crop insurance. This Committee, in accordance with the directions given by the President in a letter to the Secretary of Agriculture, was to prepare a report and recommendations for legislation providing a plan for "all-risk" crop insurance. In preparing its report, the Committee was to utilise the extensive crop insurance being studied in the Department of Agriculture. The final recommendations for the drafting of a measure were to be drawn up with the advice and assistance of national farm organisation leaders.

The President added that he considered that it would be wise for the first year, to limit the application of the plan to one or two major crops. He stated that during the previous three and a half years the Federal Government had helped farmers to meet emergencies of two kinds: the collapse of prices resulting from the huge surpluses, and the crop failures due to drought. The time had come to draft permanent measures for safeguarding farmers against risks of either kind. "Crop insurance and a system of storage reserves should operate so that the surpluses of fat years could be carried over for use in the lean years".

---

<sup>(1)</sup> REPORT AND RECOMMENDATIONS OF THE PRESIDENT'S COMMITTEE ON CROP INSURANCE. Washington, 1936, p. 5.

<sup>(2)</sup> REPORT AND RECOMMENDATIONS, p. 4.

Such measures should contribute to the general welfare: first by safeguarding the farmer's income against risks whether of crop failure or of price collapse; by protecting consumers against shortages of food supplies and against large price fluctuations; and lastly by providing an even flow of farm supplies and by stabilising the purchasing power of farmers, and thus assisting both business and employment.

The President added that he had been impressed by the work of the Department of Agriculture in developing actuarially sound methods, and particularly with regard to a crop insurance scheme which should include payment of premiums and compensation in kind. This plan should make it possible to base the premium rates on the productivity of the individual farms as shown by records of past production, of which a large number are already on the registers of the local committees of the Agricultural Adjustment Administration. By this method any payment by farmers of one region for the risks of another region would be avoided <sup>(1)</sup>.

In the course of drafting recommendations for legislation on the subject the Committee not only invited the opinion and the collaboration of the national farm organization leaders, but also consulted representatives of hail and fire mutual insurance companies, of share companies and of firms warehousing agricultural products.

At the second meeting, called by the Committee for November 7, with the representatives of the national farm organisations, a resolution was passed recommending, *inter alia*, the strengthening of the programme for the maintenance of parity income <sup>(2)</sup>, as an aid to the stabilization of supplies of farm products in the interest of both producers and consumers. With this object, a permanent programme was recommended of surplus storage and loans on farm products, with voluntary crop insurance when it appears to be practicable. The resolution added that no programme of storage or insurance could be permanently effective unless accompanied by some effective regulation of production and of distribution of farm products.

It was noted at these meetings that the wheat-growers and their representatives displayed a special interest in crop insurance, and pronounced in favour of a system of crop insurance, combined with commodity loans on the wheat in storage <sup>(3)</sup>.

The representatives of share companies and of mutual hail and fire insurance companies, at a meeting held on November 6, 1936, were of opinion that a national programme of crop insurance would prove too large an undertaking for private companies, but added that they would be ready to co-operate with the Government. It was agreed that for this purpose the companies in question would appoint representatives to take part in further discussion of schemes.

---

<sup>(1)</sup> REPORT AND RECOMMENDATIONS etc. p. 28.

<sup>(2)</sup> "Parity income", in the vocabulary of the Agricultural Adjustment Act of 1938 means an individual net income from agriculture the ratio of which to the other net income from non-agricultural sources is the same as for the period August 1909 to July 1914.

<sup>(3)</sup> REPORT AND RECOMMENDATIONS etc. pp. 8 and 9.

As the proposed plan for crop insurance involves storage problems, the Committee also conferred with representatives of warehousing firms who also declared readiness to co-operate.

As result of these conversations with the different groups concerned, the Committee reached the conclusion that a crop insurance scheme should be carried out by the Government and that, in the first instance, the scheme should apply only to wheat.

It was considered that payment of premiums and of compensation should be either in kind, or in cash equivalent. Such a plan would have the effect of forming wheat reserve stocks in good years and releasing them in years of crop failure; in this way supplies would be ensured in the event of poor harvests and fluctuations in supply and in prices would be reduced.

The Committee was of opinion that any scheme of crop insurance which combined yield insurance and formation of commodity stocks would be outside the scope of private insurance. For such a scheme to succeed it would have to be co-ordinated with the agricultural policy as a whole, and in consequence it fell within the sphere of Government action.

As we have already said private companies which had attempted any comprehensive crop insurance, after repeated losses, had been obliged to abandon the enterprise completely,

It was considered that the business of crop insurance should be assigned to the Department of Agriculture, where it could be co-ordinated with the other functions of the Department. The local administration of the scheme should be mainly entrusted to local authorities and committees established by the Department to co-operate with the Federal agencies in charge of the application of the Agricultural Adjustment, Soil Conservation and Domestic Allotment Acts.

In the Committee's view, the amount of insurance on any one farm should be determined on the basis of the average yield of that farm, and farmers should be insured for a percentage of this average yield fixed in advance. In the event of the yield being less than the premium established, the farmer should receive compensation equal to the difference between the actual production and the amount of the insurance. By this plan an excessive insurance would not be provided for farms on which the average yields are low, nor would too limited a cover be insured to farms with high average yields.

In certain cases the compensation payments might be made in wheat; or, if more practicable, the wheat might be sold and the proceeds handed over to the farmer. With the approval of the Committee the farmer might be granted instead a certificate to sell as he saw fit; but in such a case the policy holder would have to meet warehousing expenses from the date fixed for the adjustment of the claim.

The premiums might also be arranged in terms of wheat. In favourable circumstances, the farmer might pay the premium by delivering wheat to a local elevator authorized to receive it; the wheat might be stored there or consigned later to another depot. Payment of the premium in wheat would frequently be impracticable however, and accordingly the farmers should have the option of making an equivalent cash payment. In this case, the insuring body would be

obliged to accept the cash payments and to buy elsewhere the equivalent wheat for storage.

The Committee was further of opinion that the premium rate should be fixed on the basis of two factors: experience of losses occurring on the individual farm insured and the loss experience of the whole area. Speaking generally, equal importance should attach to the two factors, but allowance must be made for exceptions where unfairness might result from the shortness of the period for which data were available.

The regional average is required for the adjustment of the premium rate, as the experience of the base period adopted by the Committee—the six years 1930 to 1936—might on individual farms not be representative of local risks. In the studies of unitary yields it has been noted that sometimes in certain regions and on individual farms, disasters like hail, floods, or insect infestations occurring at long intervals have resulted in very high losses per acre for the six years in question: over a longer period, these infrequent happenings would have had less influence on the yield average. The Committee remarked that within limits local committees should have discretion to make the necessary adjustments, and outside these limits the power should rest with the Department of Agriculture. If later experience should prove that the circumstances were not exceptional but came under ordinary risks, the special adjustments would be abolished.

The operation of the insurance scheme may be illustrated as follows: at the time of sowing, a wheat farmer could apply to the local Committee for a crop insurance policy; the Committee would then fix, on the basis of the previous records of his farm, the amount of insurance in bushels per acre sown and the premium to be charged, checking the acreage under tillage and the quality of the land sown by comparison with the land under wheat in the base years.

The Committee of Enquiry recommended a plan of premium payments which would enable farmers in years of abundant harvests to pay the premiums for the next five years. This procedure would have the advantage of contributing to the work of the "ever normal granary" system. By payment of premiums in wheat during years of plenty, an additional outlet for surplus wheat would be ensured which would tend to price stabilization.

Actually, as already pointed out, the premiums would be payable in wheat, or if the policy holder paid the equivalent in cash, that cash would be employed for purchase of wheat. Hence, in the years when the premiums exceed the compensation payments, a reserve of wheat would be built up. This reserve would form stocks only in the years of surplus crops, which by definition are those when the premiums exceed the compensation payments, and in deficitary years it would be used to meet compensation claims. Thus the stocks—and this is emphasised by the Committee—would not constitute a potential supply. Accumulation and release of reserves would be automatically regulated by the requirements of the crop insurance scheme.

The crop insurance scheme as proposed by the Committee is not to be substituted for other farm programmes under administration by the Department of Agriculture, but should on the contrary supplement these. The effect of the

carrying out of this scheme on the fluctuations in supply and in prices is subsidiary to and not an inherent part of the scheme.

The Government organization for crop insurance would purchase wheat for a total amount corresponding to the premiums paid in cash by the policy holders, and the purchases would be made at ruling market prices. The sale of the wheat acquired as premium payments would not be regulated by the insurance agency but would take place upon settlement of the losses at the time which seemed most advantageous to the farmer.

The advantages of such a crop insurance programme were emphasized by the Committee. Although limited to wheat, it would reduce considerably the necessity for seed and fodder loans, drought loans and other relief credits, and there would be economy of the public finances in the matter of relief and allowances.

These financial advantages would amply justify State contribution towards administration and storage costs. There should also be remembered the economic and other advantages of this form of insurance not only to the farming class, but also to consumers and the general public <sup>(1)</sup>.

#### Law of 1938.

On February 8, 1937, Senator James P. Pope of Idaho laid before the Senate of the United States a crop insurance bill based on the findings of the Committee. Provision was made for the foundation of a Federal organization of crop insurance insuring farmers against loss in yields of wheat from drought, flood, insect infestation, plant diseases and other causes. This measure was passed by the Senate of the United States at the end of March 1937 <sup>(2)</sup>.

With certain amendments, it was incorporated into the Agricultural Adjustment Act and passed by Congress on February 16, 1938, forming Title V of this Act.

In the terms of the Act:

"It is the purpose of this title to promote the national welfare by alleviating the economic distress caused by wheat-crop failures due to drought and other causes, by maintaining the purchasing power of farmers, and by providing for stable supplies of wheat for domestic consumption and the orderly flow thereof in interstate commerce".

"To carry out the purposes of this title, there is hereby created as an agency of and within the Department of Agriculture a body corporate with the name "Federal Crop Insurance Corporation". The principal office of the Corporation shall be located in the District of Columbia, but there may be established agencies or branch offices elsewhere in the United States under rules and regulations prescribed by the Board of Directors".

"The Corporation shall have a capital stock of \$ 100,000,000 subscribed by the United States of America payment for which shall, with the approval

---

<sup>(1)</sup> REPORT AND RECOMMENDATIONS, pp. 10 to 18.

<sup>(2)</sup> THE COMMERCIAL AND FINANCIAL CHRONICLE, New York, Nov. 13, 1937.

of the Secretary of Agriculture, be subject to call in whole or in part by the Board of Directors of the Corporation....”.

“Any impairment of the capital stock described shall be restored only out of operating profits of the Corporation....”.

“The management of the Corporation shall be vested in a Board of Directors.....subject to the general supervision of the Secretary of Agriculture. The Board shall consist of three persons employed in the Department of Agriculture who shall be appointed by and hold office at the pleasure of the Secretary of Agriculture”.

“Vacancies in the Board so long as there shall be two members in office shall not impair the powers of the Board to execute the functions of the Corporation....”.

“The Directors of the Corporation appointed..... shall receive no additional compensation for their services as such directors, but may be allowed actual necessary travelling and subsistence expenses when engaged in business of the Corporation outside of the District of Columbia”.

“The Board shall select, subject to the approval of the Secretary of Agriculture, a manager... with such power and authority as may be conferred upon him by the Board....”.

For the purposes of crop insurance the Corporation has powers as follows:

1. beginning with the wheat crop planted for harvest in 1939, it is empowered to insure “producers of wheat against loss in yields due to unavoidable causes, including drought, flood, hail, wind, winterkill, lightening, tornado, insect infestation, plant disease, and such other unavoidable causes as may be determined by the Board: *Provided, however,* that for the first three years of operation under this title contracts of insurance shall not be made for periods longer than one year. Such insurance shall not cover losses due to neglect or malfeasance of the producer or to the failure of the producer to reseed in areas and under circumstances where it is customary to reseed”.

“Such insurance shall cover not less than 50 or more than 75 per cent., to be determined by the Board, of the recorded or appraised average yield of wheat on the insured farm for a representative base period”. The Board may prescribe adjustments of this average yield from considerations of equity.

“The Board may condition the issuance of such insurance in any county or area upon a minimum amount of participation in a programme of crop insurance formulated pursuant to this title”.

2. The Corporation is empowered further “to fix adequate premiums for such insurance, payable either in wheat or cash equivalent, as of the due date thereof, on the basis of the recorded or appraised average crop loss of wheat on the insured farm for a representative base period”. The Board may prescribe adjustments of the premiums from considerations of equity.

The time or times, and the manner of the collection of the premiums are fixed by the Board.

3. The Corporation is further empowered “to pay claims for losses either in wheat or in cash equivalent under rules prescribed by the Board. In the event that any claim for indemnity under the provisions of this title is de-

nied by the Corporation an action on such claim may be brought against the Corporation". The competent court is the court of the district in which the insured farm is located without regard to the amount in dispute. Any such action must be brought within one year after the date of the notification to the claimant of the refusal of the claim.

4. From time to time the Corporation may "purchase, handle, store, insure, provide storage facilities for, and sell wheat, and pay any expenses incidental thereto. In so far as practicable, however, the Corporation shall purchase wheat only at the rate and to a total amount equal to the payment of premiums in cash by farmers, or to replace promptly wheat sold to prevent deterioration; and shall sell wheat only to the extent necessary to cover payments of indemnities and to prevent deterioration.....".

Under this title of the Act, the Secretary of Agriculture is authorized to appoint from time to time an advisory committee, consisting of not more than five members, "experienced in agricultural pursuits". to advise the Corporation with regard to giving effect to the purposes of the law.

The sections of this title and subdivisions of sections are declared to be separable, and in the event of any one or more being held unconstitutional, the validity of other sections or parts of sections will not be affected.

F. ARCOLEO.

## THE PROPORTION OF ESTATES AND OF NATIVE HOLDINGS IN THE WORLD PRODUCTION OF RUBBER <sup>(1)</sup>

World rubber production is dependent upon the output of both European estates and native holdings. This has not always been the case; in fact only since 1921 has there been any question of native rubber growing in the Netherlands Indies, while it was much later again that the disastrous over-production of rubber was ascribed to the sudden appearance on the market of the native grown product. As a consequence of this overproduction, prices fell on several occasions and there was serious alarm among planters.

The raw material known as rubber was, up to the beginning of the present century, the product of primitive exploitation of the Amazon forests; it was a forest and not an agricultural product. It is only since the establishment of plantations in Asia that it has been possible to include rubber as an agricultural product resulting from the scientific cultivation of *Hevea brasiliensis*. This tree, indigenous in the Amazon basin, quickly became the successful rival of all the other rubber plants, *Castilloa*, *Ficus*, *Manihot Glaziovii*, etc., in which cultivation trials had been made at the beginning of the century.

---

(1) This article was also submitted as a report to the VIIIth International Congress of Tropical and Sub-tropical Agriculture at Tripoli in March 1939, the agenda of which includes the item "European and Native Cultivation".

\* *Ec. 3 Engl.*

A brief summary may be given of the history of the large rubber estates. In 1873 the Botanic Gardens at Kew succeeded in obtaining from the Amazon, through Mr. Markham, some hundred *Hevea* seeds. Later the celebrated consignment of 70,000 seeds, collected and transported with immense difficulty by Henry Wickham (who became Sir Henry Wickham in 1920), reached Kew in 1876. From these seeds 7,000 plants were successfully grown at Kew, most of which were sent to Ceylon. From these plants and some others, grown from seeds imported later, have sprung all the vast plantations of *Hevea* in Asia, which now supply 98 per cent. of the world production of rubber, 41.3 coming from Malaya, and 36.2 from the Netherlands Indies. The plants were introduced into Ceylon and Malaya in 1876: while the first plants, 33 in all, reached Java from Penang as late as 1882.

During the first thirty or forty years of the cultivation in Asia there were many false starts and discouragements. This was intelligible; it was a question not merely of acclimatizing a new plant under conditions of climate and soil entirely different from those of the original habitat, but also of establishing a quite new agricultural technique, the "tapping". For this operation a new technique had to be found, since tapping as practised by the "Seringueiros" of the Amazon caused serious injury to the trees, and such a method clearly could not be followed on estates where each tree represented a substantial amount of capital owing to the high cost of the seeds and the heavy expenses of clearing and planting the land.

The rise in rubber prices between 1909 and 1912, the period of the first development of the motor-car industry, led to the formation of large companies for the cultivation of *hevea*, followed by a period of speculation in rubber and in land suitable for rubber-growing. For the establishment of new rubber estates use was made of the experience acquired: by this time it was known that *hevea* did not, as certain planters had at first supposed, need marshy soils but that it could be grown on nearly all soils at an altitude of not more than 2,000 feet or so.

Rubber estates planted by the new companies were laid out with great regularity, a definite spacing of the trees was observed, roads were well kept up, while lopping and pruning of the trees was carried out, with more zeal than discretion. Unfortunately, however, the disastrous method of clean weeding was employed, a system now abandoned on account of the losses in soil caused by the consequent erosion.

Planters of *heveas* have from the first recognised the value of research stations, where the problems of the cultivation and of the preparation of the product are studied by botanists and chemists. In illustration of the practical value of these investigations, the progress due to the selection of very productive trees and the propagation of clones coming from these trees may be cited. On estates where selection is practised it is now possible to obtain yields double and even treble of those on estates consisting of non-selected trees.

A very short time sufficed for the development of the large European estates. The area of these in the Netherlands Indies increased from 176 hectares in 1902 to 104,413 in 1910, to 352,717 in 1920 and to 573,014 in 1930; it is now some

600,000 hectares. It may be noted that in Malaya the area of estates larger than 100 acres was 763,380 hectares in 1930 and 818,183 in 1936; for earlier dates no figures are available except for certain parts of the country.

This expansion of hevea cultivation could not but exercise an immense influence on the life of the populations of the regions where rubber estates were established. A certain distinction should however be made in this respect between the Netherlands Indies and Malaya.

In Java the rubber plantations have, in most cases, been established where there were already other tree or bush crops, such as coffee or tea plantations worked by Europeans. So as to obtain the ground space required, on certain land tea or coffee cultivation was given up and replaced by hevea; the alternative was to clear the jungle. In Sumatra, hevea cultivation spread in the neighbourhood of Deli, long celebrated as a centre of European tobacco-growing. In this way, rubber soon gained an important position, without however forming the one and only resource of the regions where it was cultivated.

The position in Malaya is different. Statistics show that hevea occupies the leading place. Out of a total agricultural area of 5,059,965 acres, 3,288,691 acres, or more than three fifths, were in 1937 under hevea plantation; among the other chief products rice, coconut, pineapple and oil palm may be mentioned.

It is of interest to study the influence of rubber-growing on the general economy of a specific region. The Non-Federated State of Johore may be taken, the choice being made purely at random, as any of the other Federated or Non-Federated States would show similar conditions.

According to travellers' descriptions, in the first half of the XIXth century the Sultanate of Johore was in a state of complete desolation; according to the 1937 returns there are now 613,510 inhabitants (930 Europeans, 350 Eurasians, 267,500 Malaysians, 268,300 Chinese, 72,600 Indians, 3,800 of other nationalities). Thus two immigrant races, the Chinese and the Indian, are very important, and a large proportion of these races works on the hevea plantations. The total number of workers employed on private undertakings amounts in fact to 82,594, or more than 10 per cent. of the whole population. Precise figures are not available as to the proportion of this total engaged on the rubber estates but it would not be far from the truth to estimate it at 80 per cent. The total of the rubber exports amounted to 86,000,000 Straits Settlements dollars, while that of the total agricultural exports was 96,000,000 dollars.

The State revenue exceeds expenditure, and there is no public debt in spite of the heavy expenses for education and medical services. No other cultivation, with the possible exception of that of palm-oil, would have been capable of bringing about so fundamental an improvement in the prosperity of vast territories. On the other hand it is certain that the replacement of natural by synthetic rubber would bring about the irreparable ruin of all these regions.

The object of this first part has been to make clear the extent to which the large European estates have contributed to the welfare of the Asiatic countries, especially Malaya and the Netherlands Indies. It may be noted, in passing, that during the first years of rubber cultivation the necessary measures

for preventing soil exhaustion, whether by erosion or by a too intensive working, were rather neglected. The importance of conserving that most valuable capital of all, the soil, was however soon recognised by adopting measures against leaching and by using green manure and cover crops.

We now pass to "native cultivation". It is convenient to make a distinction between Malaya and the Netherlands Indies, the two countries here dealt with.

The Malaya statistics distinguish the areas occupied by "estates" from those occupied by "small holdings". The estates or large plantations are defined as holdings of more than 100 acres, the small holdings as those less than 100 acres. Theoretically there is no difference based on the race of the owner, but it is rare for a "small holding" to be managed by a European. On the other hand, "estates" are sometimes owned by Chinese, Malaysians or Indians.

The growth of the "small holdings" is due to the policy followed by the British administration, which, while encouraging the development of European or Asiatic capitalist plantations or estates, reserves much of the land for the requirements of the native population. In this connection the Malay Reservation Enactment of the Federated States of 1913 may be quoted, which empowers the governments of the States to select at their own discretion regions as Malayan reserves, upon which the alienation of lands to other nationals is prohibited.

In 1934 a special department was established at the Kuala Lumpur Central Rubber Station for the inspection of "small holdings"; some twenty inspectors are attached to this service, of whom three fourths are Malaysians, the remainder Indians and Chinese. The first success achieved by the new service was the improvement in the quality of the rubber produced by the small holdings. Small smoke-houses of special type were prepared for sheet rubber; their construction was simple and their cost price such that the small holders could easily purchase them. The success was so great that in 1936 there was not enough rubber of inferior quality on the market to meet the requirements of customers who wished to pay lower prices. Reductions were made moreover in the prices asked by the central establishments for drying and smoking rubber from small holders who did not possess the plant required for the treatment of the sheets. Efforts have also been made to encourage bud-grafting, to improve soils by drainage and by means of cover and green manure crops, and of diffusing information as to methods of control of the principal plant diseases. Attempts at improving tapping have not so far given satisfactory results.

The following information on the share of native cultivation in the total production of rubber in Malaya is taken from the statistics of 1937:

*Area.* — More than one third of the total area of rubber plantations in Malaya, viz., 1,278,309 acres out of 3,304,657 acres, consists of "small holdings".

*Production.* — More than one third of the total production of rubber, viz., 188,836 metric tons out of 503,494, comes from the small holdings.

Native cultivation of hevea in the Netherlands Indies attracted the attention of international trade for the first time when, about 1920, constantly increasing quantities of native rubber reached the ports of embarkation: in 1921 the

total exports from Sumatra and Borneo amounted to 5,998 tons; in 1922 to 25,517 tons, in 1923 to 53,507. It was considered, in view of these figures and as hevea trees begin to yield rubber at about 7 years of age, that the plantations from which the first large consignments of rubber came must have been planted about 1915. It has however been recently proved that the origin of native hevea planting is earlier: It was actually in 1905 that the Malay population of the coasts of Sumatra and Borneo, a population which had always maintained numerous trade relations with Singapore, began to take an interest in the young hevea plantations which were then to be seen in the neighbourhood of Singapore and the other ports of the Malay peninsula.

It is curious that the native rubber holdings were not formed in the same regions as the European estates, but in quite other parts of the Netherlands Indies archipelago. The beginning of the native cultivation was thus entirely due to the initiative of the populations of the Palembang and Djambi Residencies in Sumatra and of that of Borneo. The regions inhabited by these peoples contain immense virgin jungle and large rivers which are the only means of communication with the interior; they are thinly populated.

Between 1910 and 1914 a considerable trade in hevea seeds was reported, between Malaya and the districts of native cultivation in Sumatra and Borneo. The purchasers were Chinese and Malays who later sold plants to the cultivators.

The "*landang*" method is universally applied in the districts in question; this method consists in burning the forest so as to cultivate for a time a certain area of land which is abandoned after some years, and a new clearing undertaken. Rice is the principal crop; hence it seemed quite natural to associate the new cultivation of hevea with the old one of rice, and to plant the young heveas on the ricefields after the rice harvest was gathered. Another practice was to plant the heveas as soon as the land was cleared and a little while before the rice was sown. Rice was followed by another annual crop and this in its turn by another rice crop. By that time the heveas have reached a height which makes it impracticable to continue a catch crop. Thereupon cultivation stops; agriculture is so to speak replaced by silviculture.

The spacing of the trees is much reduced, 3.50 by 3.50 metres being the most usual distance. This makes it possible to plant 800 trees to the hectare, whereas on European estates there are not more than 300. In this way, hoeing soon becomes unnecessary, any growth of weeds is checked by the dense shading and the moist atmosphere which, at the same time, keep the soil damp.

The number of trees belonging to a single owner is considerable. Assuming that a peasant clears in one year a *bouw* (0.6 ha.) of jungle, growing food crops on each plot for at most three years, more than a thousand trees can be reckoned per owner after three years. This is an average reached after taking account of losses due to jungle fires and sales of plots of land. On the other hand there are some owners who are known to possess 20,000 trees and more.

During the first period of native cultivation, tapping was carried on by primitive processes which injured the trees. It was seen that these methods might prevent satisfactory regeneration of the bark, and methods of tapping have lately greatly improved as a result of the information made available by

the Government for the native planters. In addition the hevea trees have proved less susceptible to injury than was supposed at first.

Coagulation is effected in a very primitive manner. The latex, after collection in petrol tins, is coagulated on the spot by adding large quantities of alum. The coagulated mass is rolled out on a plank, using a bottle as roller. The cakes thus obtained are dried in the sun; for transport to markets all kinds of vehicles are used, bamboo rafts, carts, lorries, bicycles, etc.

Buyers who attend the inland markets buy up these cakes for resale to the large remilling establishments, the majority of which were in the early days at Singapore. There a product is turned out which, under the name of "blanket", has acquired a great reputation on the world market. Factories of this type are now installed among the plantations; in Sumatra and Borneo there were 16 in 1932, and in 1936 there were 45 with a total output of 53,000 metric tons of processed rubber, or about one third of the whole native production.

In the last few years decided progress has been reported in the preparation of rubber; the water content of the native product has been considerably reduced, the proportion of high quality rubber (blanket and cheet) has been increased, while that of low quality (scraps and slabs) has decreased.

The way in which the problem of labour in native cultivation has been solved is interesting. During the boom in rubber prices the tapping of the trees could not be done by the owner's family alone. Neighbours whose plantations were not yet fully grown were called in to help, and also Javanese already in the country; some workers were brought over from Java specially.

The system of payment of workers is quite original; it is called "*bagi dua*" in Malay, and is a kind of share working, where the owner and the workers divide between them the proceeds of the rubber sales. This agreement was entirely satisfactory both to the worker and to the employer. It is only during the periods of price decline in rubber that it does not answer. There are then two possible solutions: either the worker is dismissed and family work reinstated, or the share of the workers is increased, either by adopting the system of "*bagi tiga*" under which the workers receive two thirds, or that of "*bagi lima*" when three fifths of the price is assigned.

Native rubber-growing has shown itself admirably adaptable to the consequences of crises in the rubber market. The first reaction to a price fall is to send away as many workers as possible, and to have the work done by the owner's family. If prices continue to fall, tapping ceases and is resumed only when prices recover. The standard of life is easily adapted to the incomings: during boom periods all luxuries that can be obtained are secured: jewellery, house decorations, sewing machines, bicycles, motor-cars, etc. When the slump comes, rice-growing is intensified and rubber trees are not planted.

Rubber restriction, decided on in pursuance of the international agreement of May 7, 1934, came into force on June 1, of the same year. The Government of the Netherlands Indies, with a view to bringing the native growers into line with the restriction measures undertaken for the benefit of the whole rubber industry, native and European, felt it necessary to impose an export duty on native rubber. It was impossible at that time to impose a restriction

—such as was applied to the European companies—on the individual production of each native owner, since the necessary information was not available as to the number of the planters and trees, nor particulars as to areas planted.

Individual restriction only came into force on January 1, 1937. The necessary statistics had been collected and relatively precise figures obtained, making it now possible to estimate the place of the native small holdings in the total production of rubber of the Netherlands Indies.

On the basis of the 1936 returns, there were known to be 788,438 native owners of hevea plantations, possessing 582,382,725 trees out of which 140,647,781, or about one quarter, had not yet reached their full growth. The area—a calculation not based on topographical survey and consequently approximate—was about 681,187 hectares as compared with 595,777 for the total extent of the European estates at that time. The total area of the hevea plantations of the Netherlands Indies is estimated at 1,276,964 hectares, or 12,769 square kilometres, *i. e.* nearly half the area of Sicily.

As was done for Malaya, a concrete case may now be taken, *viz.*, that of the Residency of Djambi in Sumatra. This Residency covers an area of 44,923 square kilometres, or about the area of Switzerland. The greater proportion of this area is covered with virgin forest. The population is 245,272 inhabitants, including 120,386 native males. Among these are 43,189, owners of rubber plantations, or more than one third of the male population. An idea may thus be formed of the immense importance of the hevea cultivation for a people who previously knew nothing except rice cultivation or the arduous business of gathering jungle products, such as rotang, resins etc., and whose lives were passed in regions where no success had attended trials of other crops, such as coffee or cotton.

In the early stages, the native working of hevea was looked upon as a danger for the capitalist cultivation as, at certain moment, it flooded the world market and was even the most in demand. At the time of the world crisis, when adaptability was important, there was, so to speak, more elasticity about the supply than in that coming from the European estates. Further, the native-grown rubber caused complications in regard to the production restriction measures, intended to prevent over-production and to check fall of prices. No serious effects however supervened on the cultivation of the large estates; during the world crisis this also adapted itself to the circumstances, with moreover a reduction of the cost price to a level which makes it possible for the companies once more to pay dividends.

Native and European cultivation accordingly exist side by side in the great regions of production—Malaya, Netherlands Indies and Ceylon. Thanks to the energy and the perseverance of the managers or of the owners during crisis periods, both types of working have justified their existence. By means of the hevea, whether native-or European-grown, vast regions formerly poverty stricken have been transformed into regions where the native population have comfortable houses and sufficient food—where, in a word, they live well.

Humanity owes to more than one race the certainty of always having available sufficient quantities of rubber. It was Indians of the Amazon forests

who were the first to notice the strange qualities of the coagulated latex of certain wild trees; the Portuguese *seringueiros* risked their lives to penetrate into the "Green Hell" in order to tap the trees; English and American pioneers, were the inventors of the vulcanisation process; others carried the seeds from the Amazon to England, then to Ceylon and Malaya. Much too is owed to the British, Dutch and French planters and students who, during the first period of the cultivation, when no one could foresee the future, persevered in the cultivation or in the study of the hevea, and later established all the immense rubber estates which, by means of scientific selection, have succeeded in doubling yields. Lastly much is owed to the Malay peoples who, on their own initiative, established a new cultivation, which they have transformed in a remarkable manner, taking into account the economic possibilities of their country.

In conclusion, it may be affirmed that the cultivation of *Hevea brasiliensis* is feasible for any intelligent native population with a commercial mentality. Native cultivation does not necessarily mean a competition which is fatal to European cultivation. The two can exist side by side.

Dr. Walter BALLY.

## **INTERNATIONAL CHRONICLE OF AGRICULTURE**

### **ARGENTINA**

From 1933 there was a slow rise in the prices of raw materials, becoming more rapid in July 1936 and reaching a maximum in the first quarter of 1937. The fall in March 1937 was as sharp, if not as large, as the rise. Subject to the business cycle in industry, price movements for raw materials were in general downwards at the end of 1937 and during 1938, despite temporary recoveries which did not sensibly alter the general trend. Thus world prices for raw materials were much less favourable to Argentine exports in 1938 than in 1937.

#### *Principal Crops exported by Argentina.*

Year		Output in metric tons	Exports in metric tons for the corresponding civil year
Wheat . . . . .	1935-36	3,850,000	(a) 1,724,362
	1936-37	6,782,000	(a) 4,023,180
	1937-38	5,029,500	(a) (b) 2,300,000
Maize . . . . .	1935-36	10,051,206	8,381,600
	1936-37	9,134,530	9,087,363
	1937-38	4,424,000	(b) 3,000,000
Linseed . . . . .	1935-36	1,510,000	1,487,926
	1936-37	1,935,000	1,802,048
	1937-38	1,539,400	(b) 1,300,000

(a) Wheat and flour. — (b) Provisional figures.

Further, not only were the 1938 harvests less satisfactory than those of 1937, but the advantage enjoyed by Argentine exports in the latter year owing to the big increase in world stocks and the poor harvests of wheat and maize in Canada and the United States disappeared in 1938, and competition from the surplus output of these commodities again had to be met.

Crop variations also had a great influence on the quantities exported; these were smaller by 55.8 per cent. than those of the corresponding period for 1937. The quantities of animal products exported varied little, maize, wheat and linseed accounting for 8.2 million metric tons of the total fall in exports of 8.4 million metric tons. During the first nine months of 1938 1,649,333 metric tons of maize were exported, compared with 7,371,137 metric tons during the corresponding period of 1937.

Variations in the value of foreign trade, as shown in the table below for half-yearly periods, have been even greater:

*Argentine Foreign Trade:*

In millions of pesos.

	1936		1937		1938	
	1	2	1	2	1	2 (a)
Exports . . . . .	723.2	932.4	1,409.3	902.1	712.6	553.7
Imports . . . . .	538.9	577.7	669.1	883.4	747.3	575.9
	+ 184.3	+ 354.7	+ 740.2	+ 13.7	— 34.7	— 22.2

(a) 5 months.

The figures for the value of exports show an increase in the first half of 1936 and reach a maximum during the first half of 1937 with the record figure of 1,409 million pesos. For the first half of 1938 the figure was only 712 million pesos — half the former amount — and it fell still further during the second half of 1938. These variations are explained by the remarks made above about world prices and harvests.

On the other hand, the variations in value of imports do not correspond exactly with those of exports. In the first place, as might be expected, the variations in the value of imports are smaller.

In the second place the variations are not synchronous, imports reaching their maximum in the second half of 1937 while exports reached their maximum in the first half. In other words, the value of exports was decreasing during the second half of 1937 while that of imports continued to increase.

The normal seasonal increase in exports (from January to April) is not enough to explain this disparity. The real reason for the high import figures is that some time must elapse before the exceptionally large profits obtained while the price of raw materials are high, can be realized and brought into circulation. Thus important orders for agricultural machinery and vehicles were placed before the fall in prices.

There has consequently been a slight fall in the balance of trade over the two half years of 1938. The regulation of imports remains necessary to enable interest payments on foreign loans to be continued. From November 9, 1938 the official selling rate of exchange for the pound sterling rose from 16 pesos (the rate of exchange in

force from December 10, 1936) to 17 pesos—a not insignificant monetary depreciation. The buying rate is maintained at 15 pesos per pound sterling.

Exchange control, introduced on November 29, 1933, continues, and the peso has three recognized rates, two official rates, (one for buying and one for selling) and the free rate. Foreign bills for regular exports (excluding wool) must be sold to the Central Bank at the official buying rate. Since January 2, 1936 the Bank has been ordered to sell them at the official selling rate to the holders of permits supplied by the exchange control commission. Bills for "supplementary" exports, freed blocked accounts, transport, etc. are dealt with on the free market at the free rate. Exchange control is very important for Argentina's agricultural policy, as agriculture is subsidized from the gains made by exchange operations.

Thus in 1937 and 1938, Argentina's economic position was first very prosperous and then distinctly less satisfactory. Prospects for 1939 are favourable and crop estimates are very satisfactory. It might be said that having made up in 1936-37 the losses suffered during the great depression, Argentina underwent a further recession in 1937-38; but learning from former experience, she has been able to stave off a serious depression by means of her very effective system of regulation.

Agricultural policy, while introducing no important innovations of principle, has been marked by increasing Government action; restricted in 1937 and more intense in 1938, it now affects all branches of agriculture.

### Trade policy and immigration agreements.

Argentina conducted a very active trade policy during 1937 and 1938, and a great number of agreements were signed. These agreements, the majority of which were based on the most-favoured-nation clause, were drawn up for a short period and were easily renewable. They come under three heads.

The first class includes a series of treaties based on the most-favoured-nation clause concluded with certain European countries playing a relatively unimportant part in Argentina's foreign trade.

1. With Czecho-Slovakia (May 21, 1937). In an appendix Czecho-Slovakia allows Argentina to import fresh grapes by means of lower tariffs, while Argentina allows the import of Czecho-Slovak hops.

2. With Hungary (December 24, 1937).

3. With Poland (August 31, 1938). An additional agreement fixes the maximum duties for imports into Poland of Argentine potatoes and grapes during certain periods of the year.

4. With Greece (November 23, 1938). An appendix to the treaty fixes the maximum duties for imports into Greece of certain Argentine products (hams, cheeses, butter, skins, tannin extracts, maté, wool, etc.) and for certain Greek products (tobaccos, raisins, sponges) into Argentina.

5. With Lithuania (November 25, 1938).

In the second group come trade agreements with Argentina's neighbour States.

1. With Peru (February 3, 1937). Before signing an actual commercial treaty, the *modus vivendi* for the relations between the two countries was regulated by an agreement: an annual quota of 10,000 metric tons of Argentine wheat is admitted duty free into Peru; Argentina has lowered the duties on non-refined petroleum from Peru in such a way that each year this reduction compensates for the free allowance granted by Peru to Argentine wheat; in certain cases the wheat quota may be increased.

2. With Chili (February 18, 1938). A supplementary agreement to the trade treaty of June 3, 1933 adopted the most-favoured-nation clause. Further, Chili granted prefer-

ential treatment to imports of cattle (in particular, 60,000 head of cattle are admitted free each year) and of books; Argentina grants this treatment to dried vegetables, garlic, wood and certain mineral products from Chili.

The third class covers commercial agreements reached with countries holding an important place in Argentina's foreign trade.

1. With Italy (March 4, 1937). A supplementary agreement to the trade treaty of 1894 confirms the application of the most-favoured-nation clause, while a further convention deals with payments. Large quotas are fixed annually for the following Argentine products: wheat, maize, wool, chilled and frozen meat, linseed, etc. To balance this Argentina agrees to pay the official rate of exchange in all payments for goods imported from Italy up to a value equal to that of purchases made by Italy from Argentina. Trade between these two countries has been greatly increased by this agreement.

2. With France (February 18, 1938). An additional agreement to the convention of August 1932 was signed which extends most-favoured-nation treatment to internal duties. It grants Argentina 10 per cent. of the bran quota, 30 per cent. of the quota for maize imported into France under the direct imports system, 30 per cent. of the quota for maize imported under the special system of temporary imports, and the whole quota of maize for starch works, 60 per cent. of the chilled mutton quota, 10 per cent. of the frozen meat quota, 25 per cent. of the tinned meat quota and 10 per cent. of the butter quota. France receives reductions in the duties on her brandies. The clauses dealing with payments give France a type of exchange not less favourable than that granted to other countries. Bills for regular exports of Argentine products into France are allotted, after deducting a reasonable amount, in the following order: towards the public debt, in settlement for goods of French origin imported into Argentina and towards financing French undertakings in Argentina.

3. With Germany. The trade treaty signed in September 1934 has been renewed for 1937 and 1938. Supplementary clauses arrange for the improvement of trade between the two countries and, in particular, payments are facilitated. Import quotas for chilled meat have been substantially increased.

Finally, immigration agreements were reached with Switzerland (July 6, 1937) Denmark (September 21, 1937) and the Netherlands (April 19, 1937 and September 16, 1938). These agreements allow colonization by selected types of immigrant in the sparsely populated districts of the country, account being taken of the interests of each of the signatory States. Apart from these, general measures have been taken from December 1, 1938 which aim at restricting immigration.

Argentina has therefore been pursuing a very active commercial policy for the last two years. To coordinate the work of the different organisations concerned a permanent interministerial commission for economics has recently been formed [Decree of November 29, 1938-December 3, 1938 <sup>(1)</sup>]. It consists of representatives of the Ministries of Foreign Affairs, of Finance and of Agriculture; it prepares commercial negotiations by studying the home and foreign markets; studies the effects of commercial treaties on the national economy, and keeps the Government informed of commercial developments so as to enable it to take suitable measures.

As regards the customs tariff, not only are imports taxed by a 10 per cent. duty, but from December 1, 1938 (Decree of November 7, 1938) a permit must first be obtained for all imports.

---

<sup>(1)</sup> The first date is that of the signing of the decree, the second that of its publication in the Boletín Oficial.

### Cereals and linseed.

The output and export of cereals were large during the 1936-37 season but greatly decreased during 1937-38. Prohibitions on exports of flour and wheat were maintained for only a short period. They were introduced in November 1937 but gradually withdrawn as crop expectations showed that there would be no shortage of home supplies of these goods.

To secure more rational use, several decrees (February 14, March 10, 1938 and October 31, November 5, 1938) introduced a classification of flours by which these goods can be employed in the uses to which they are suited. The National Commission for Grain and Elevators continued its operations and the plan for constructing elevators was proceeded with. From January 1, 1939 (Decree October 24-November 2, 1938) 0.02 pesos per quintal of cereals and linseed exported had to be paid into the account of this commission.

In November 1938 the Wheat Regulating Committee was again instructed to maintain cereals and linseed prices. The Committee was formed on November 29, 1933, and is financed by the Exchange Control Commission. It maintained the prices of wheat and linseed till December 1936 and of maize up to January 1937. The rise in prices then made its operations unnecessary. But in 1938 the fall in prices called for further intervention. A Law of October 7-October 17, 1938 permitted the Government to establish minimum prices for wheat, linseed and maize, etc. or to grant subsidies to producers in support of national production. The minimum prices and subsidies, which apply only to the next crop, are fixed so that "costs of producing cereals and linseed in the different parts of the country may be protected". The necessary funds are supplied from the difference between the rates of exchange, and if this is insufficient the National Bank of Argentina makes advances. By a decree of November 14-23, 1938 the basic price per quintal of wheat (No. 2 specific weight: 78) was fixed at 7 pesos, and per quintal of linseed at 13 pesos. On November 4 the prices of the products were respectively 6.05 and 12.62 pesos on the Buenos Aires Stock Exchange.

### Meat and cattle.

During the last few years the volume of exports of chilled meat changed relatively little, but there was a considerable increase in output owing to the increase in home consumption. The Government attempted to improve the distribution of this product, and while the National Meat *Junta* continued to function, the "Cattle and Meat Market" Company was formed by a decree of May 31-June 25, 1937. It is in the form of a commercial company whose shareholders must be stockraisers. The shares are personal and may only be transferred with permission of the Company. The Company is run by a Board of Directors who are elected from among the shareholders at the General Meeting. This Company and the National Meat *Junta* work in close cooperation, and the charges for services rendered by the Company must be approved by the *Junta*.

The company sets up, buys and administers cattle and meat markets, refrigerators and warehouses; these establishments enable meat and cattle to be stored, classified and sold under conditions favourable to consumption and conforming to hygienic requirements. Although the home market absorbs a continually increasing part of the national output, the Government has also made efforts to maintain exports. To indemnify beef exporters for the duties that must in future be paid on importing their products into the United Kingdom, they receive provisionally (from January 1937) a

subsidy of 1.65 pesos per pound of beef. The Exchange Transactions Fund pays the necessary sums to the National Meat *Junta*, which then redistributes them.

At the end of 1938 the drought led to an increase in supply and a decrease in exports of meat, so that prices fell. By a decree of December 8-13, 1938 subsidies were granted from December 12, 1938 to March 31, 1939 on the sale of cattle (mixed bred) for immediate slaughter, whether for export or home consumption. This regulation will remain valid until June 30, 1939 for animals coming from the *Littoral Norte* and sold directly to industrial concerns. The *Junta* will receive the money required to pay the subsidies from the Exchange Fund.

### Wool.

An advisory Wool Committee consisting of officials and representatives of those interested was formed by a decree of April 26-May 24, 1938. It gives advice to the Ministry of Agriculture on legislative measures, helps to prepare international agreements and suggests to the Institute for Wool Research the lines of its work. To ascertain the quantities of stocks and to take measures required to improve the market, a decree of May 11-28, 1938 made it obligatory to declare periodically to the Institute for Wool Research the quantities of wool on the market, in warehouses and in industrial establishments, etc.

### Milk and milk products.

The economic importance of milk products and the fact that milk is a primary commodity led the Government to set up an "arbitral tribunal" to fix the prices of milk both for direct consumption and for manufacturing purposes (Decree of August 19 to 25, 1937). The lack of rationalized production in the milk trade and industry had led to an inequitable distribution of profits. The "arbitral tribunal" fixes equitable prices, prevents conflicts and protects the interests of consumers. The tribunal consists of a Chairman appointed by the Government, two representatives of production, one industrial representative and one trade representative. A Department for the Milk Industry (Decree of February 11-March 10, 1938), has also been formed, which replaces the regulating *Junta* for the milk industry and the independent *Junta* for supplying milk to the capital. This department is concerned with the production, industry, trade and transport of milk products within the country, and with exportation. Registration is obligatory for all persons whose work is connected directly or indirectly with the milk industry. The Department is assisted by an advisory council consisting of officials and representatives of the producers.

To prevent margarine being sold as butter and to ensure that this product is hygienically prepared, production and trade in margarine have been regulated. (Decree of January 15-February 15, 1937). Margarine producers are obliged to register with the Department for Stockraising and they may only carry on their work if their factories fulfil certain hygienic conditions. Further, the composition of the products is regulated and they are marked in a definite manner according to quality.

### Wine.

The wine *Junta*, set up by a law of December 24, 1934, has been carrying out its task of ensuring that "the national output of wine does not exceed the normal requirements of the population". Further, a law of January 29, 1937 (February 17, 1937) arranged for the wine *Junta* to acquire vineyards covering an area sufficient to reduce the annual output of grapes by 2,000,000 quintals. Lands bought from vine-growers

pass to the State and are divided up into small holdings, which are then sold to the families of agricultural labourers who must agree not to cultivate the vine. Selling prices are not high and financial assistance from the State enables purchasers to attain independence by means of annual payments.

Thus the vine area is rapidly being reduced. At the time of the 1937 harvest, the area of vines in Argentina had already been reduced by 4,125 hectares, being then only 145,687 hectares.

The same law (January 29, 1937) reinforces the marketing organization for wine so that gluts may be avoided. Each year before June 30, the executive fixes, at the suggestion of the Wine *Junta*, "the annual surplus of wines which should be prevented from coming on to the home markets to avoid exceeding their capacity of absorption". For the current year this surplus was fixed at 2,830,500 hectolitres (Decree of June 29-August 9, 1938). Each vine grower must hand over a certain part of his crop to the *Junta*. The *Junta* may then either sell the wines so bought on the home market if required, or export them, or convert them into derivative products. The law also empowers the *Junta* to take all measures to improve the distribution of this product and to increase consumption (with the assistance of an auxiliary cooperative organization).

In furtherance of these attempts to organize viticulture, the Government passed a series of new regulations in a law of August 12-29, 1938. A central Department for vine-growing and the wine industry, attached to the Ministry of Agriculture, was formed, which "has powers to deal with all matter relating to the wine and vine industry, the supervision of trade and technical inspection". A national Commission for the wine and vine industry, consisting of officials and representatives of the vine-growers submits its views and proposals about measures proposed.

The same law gives a precise definition of the various alcoholic products (wines, ciders, liqueurs etc.) and decides which processes are legitimate and which should be prohibited in the manufacture of these products.

A system by which declarations of harvests are obligatory has been introduced to allow the Central Department for vine-growing to follow market developments. The home trade in wines is very strictly controlled, the import of foreign wines and alcoholic goods being permitted only if certain conditions are fulfilled. The Central Department of the National Chemical Laboratories conducts analyses to ensure that the law is being observed; penalties are prescribed.

There are also many laws regulating the production of wine alcohols and small wines, etc.

There has thus been a great deal of Government intervention; that it has been effective is shown by the rise in prices since 1936.

#### *Red Wine in Tank Wagons at Mendoza.*

Indices (1930 = 100)

1934 . . . . .	78.2
1935 . . . . .	83.9
1936 . . . . .	80.7
1937 . . . . .	90.7
1938 (first nine months only) . . . . .	89.7

#### **Potatoes.**

A decree of October 26, 1934 empowered the Ministry of Agriculture to deal with difficulties affecting the potato market. An administrative commission, formed provisionally, to carry out this work, decided to have all transactions centralized. By this means prices and weights of the goods could be supervised, a classification according

to quality introduced and a scientific inspection of sanitary conditions maintained. In future (Decree of January 27,-February 17, 1937) the working of the market will be directed by an official of the Ministry of Agriculture who will apply the regulations. An advisory committee consisting of representatives of producers and dealers gives its opinions and proposals. In case of disagreement with the official directing the market, the Ministry of Agriculture settles the dispute. Thus the separate organizations are effectively supervised.

### **Encouragement of tobacco production.**

The inadequacy of the national output and the high prices of imported tobacco decided the Government to extend the cultivation of this plant. No technical difficulties arise since there are parts of the country where all the conditions required for the successful cultivation of tobacco are found.

A decree of February 5-12 April 1937 determined the organization and functions of the Department for tobacco production. The Department, which is attached to the Ministry of Agriculture, consists of a technical and an economic section. It regulates plantings and fixes the areas in which the different varieties may be cultivated. It prepares statistics, conducts sales research and improves storage and transport conditions. Further, to make supervision stricter, a decree (May 11-28 1938) made it obligatory for all persons concerned with this cultivation, trade or industry to register with the department for tobacco production.

### **Standardization of agricultural equipment.**

A National Commission for the Standardization of Equipment (Decrees of December 14, 1937, October 5-31, 1938 and October 7-31, 1938) proposes to the Government, after consideration, rules for standardizing agricultural equipment. It is assisted by the Institute for the Rationalization of Equipment, an organization for coordinating technico-scientific research.

### **Fruit trade.**

A decree of February 12-to March 10, 1938 regulates all matters relating to the quality, marks of origin, arrangement and packing of dried fruits for the home and export markets. A decree of September 2-7, 1938 laid down similar regulations for imported dried fruits to ensure equality of treatment between the native and imported products.

### **Campaign against insects and cattle diseases.**

Much has been done in the fight against locusts. A research institute, working under the Department of Vegetal Hygiene, was set up (Decree of June 21,-1 September 23, 1937) and has been granted credits amounting to 10,000,000 pesos for the purchase of materials and for preliminary work (Decrees of June 21,-January 13, 1938 and October 7-17, 1938). Prices of metal fences were kept low, so that landowners could buy them easily. Thus the high costs of transport and upkeep which were previously borne by the State have been avoided. (Decree of October 11-November 4, 1937).

The campaign against different types of tick on cattle and domestic animals has been made obligatory in all regions (Decree of October 7-17, 1938). Landowners must attend to the animals on their own farms and use the State equipment. An initial grant of from 4-500,000 pesos has been made and it is expected that in future 500,000 pesos will be paid annually.

### Internal settlement.

The lands bought by the State with a view to reducing the output of wine (Law of November 29, 1936) were used, after being cleared of vines, to form small peasant properties. These "enable the family to become attached to the soil and ensure intensive and independent production". A decree of February 17-March 15, 1938 set up, a commission for the administration of settlement lands independent of the Department of Agriculture. This commission divides up the lands into pieces of under 5 hectares and fixes their value. The law determines the conditions which must be fulfilled to obtain one of these pieces.

### Farm credit.

The arrangements for farm credits have been modified by several laws and decrees. According to a decree of April 3-6, 1937 no person or institution granting mortgage loans might accept deposits unless it set up an independent section for mortgage operations with separate capital or funds obtained from the sale of bonds. At the request of the National Mortgage Bank, the maximum area for settlement allotments was fixed (Decree of October 26-November 4, 1937) at 200 hectares, and the maximum amount of individual loans to colonists or purchasers at 50,000 pesos. A decree of March 26-29, 1938 allows the National Bank of Argentina to grant loans for the purchase of seed and draught animals to settlers in areas affected by the loss of the last crop. The total amount of such loans must not exceed 9,000,000 pesos. A decree of August 31-September 26 (modifying the law of May 15, 1933) prescribes regulations relating to credit operations, mortgages, and the length and amount of loans. A decree of September 25, 1938 enables stockraisers to obtain credits on easier terms. A law of October 10-14, 1938, supplemented by a decree of November 15-31, 1938, introduces a new system for bonds with a mortgage guarantee.

## LIBYA

Libya is agriculturally a region of arid climate. Compared with the total area the cultivated and cultivable parts are few and limited. But despite the infrequent rainfall and the absence of permanent water-courses there is no absolute lack of water owing to underground phreatic and artesian waters. In Cyrenaica these are supplemented by numerous springs, while in Eastern Jebel the rainfall is more regular and plentiful.

However, the only part of Libya which is cultivable, and therefore colonizable, lies along the coast, consisting of the Jefara and the area contiguous to Jebel, in Tripolitania, and of the plateau of the same name and of part of the Bengazi plain in Cyrenaica.

The chief crop in Tripolitania is the olive. Almonds and vines are also important. On the Jebel, in the Tigrinna area, the cultivation of oriental tobaccos is being undertaken on a large scale by means of a colonization plan settling 500 families in the Garian.

At present cereals are the principal crop in Cyrenaica, chief among which are barley and, to a smaller extent, wheat. The natives generally grow these two cereals, the Italians on the other hand preferring olives, almonds and grapes, though they grow some wheat also.

According to the first census of Italian colonists' farms in Libya (April 21, 1937) <sup>(1)</sup> which supplied data on certain agricultural aspects of this territory <sup>(2)</sup>, the farms of Italian colonists were distributed thus:

*Classification of Farms according to Type of Tenure.*

Province	Total		In concession		In full ownership		Part in concession and part in ownership		In State ownership	
	Num-ber	Area: hectares	Num-ber	Area: hectares	Num-ber	Area: hectares	Num-ber	Area: hectares	Num-ber	Area: hectares
Tripoli . .	593	98,429.85	332	86,605.66	235	7,285.30	15	4,249.91	10	288.98
Misurata . .	30	28,580.61	17	27,310.52	11	250.65	—	—	2	1,019.44
Bengazi . .	193	32,443.64	25	19,966.57	156	7,145.36	3	5,073.00	9	258.71
Derna . . .	24	28,295.01	11	25,619.98	13	2,675.03	—	—	—	—
Total . . .	840	187,749.11	385	159,502.73	416	17,356.34	18	9,322.91	21	1,567.13

A classification by size of the same holdings gives 176 of 5 hectares and under, 227 of from 5 to 20 hectares, 159 of from 20 to 50 hectares, 133 of from 50 to 200 hectares and 145 above 200 hectares.

Of trees, dry and semi-irrigated, olives covered 23,735 hectares, almonds 3,873, vines 1,629, others, 552.

There was also joint production of these trees, 28,419 hectares with olive and almond trees, 8,188 hectares with olive trees and vines, 164 hectares with almond trees and vines, 1,511 hectares with olive trees, almond trees and vines and 2,100 hectares with other trees.

According to the census there were 5,514 ploughs, 1,219 harrows, 971 *mahascic*, 288 cultivators, 279 sowing machines, 180 tractors, 127 mowing machines, etc.

There were 2,097 wells, 656 cisterns and reservoirs with a total capacity of 83,217 cubic metres, and 1,528 basins for collecting water with a total capacity of 623,851 cubic metres.

Many different methods of pumping the water were used.

The farms covered by the census were adequately supplied with dwelling houses, barns, storehouses, cattle sheds, dung hills and silos.

The numbers of livestock were 2,046 horses, 737 asses, 1,299 mules and hinnies, 592 dromedaries, 7,714 head of cattle, 73,202 sheep, 9,199 goats and 1,707 pigs.

Native agriculture is intensive in the *suani*, small irrigated gardens where the water is drawn from the sub-soil by wells. Dates (more than 3 million date palms with an output of from 300,000-400,000 quintals of dates par annum) are the main crop of the *suani*. Barley, the staple food of the native, is the chief cereal crop. The principal industrial crops are tobacco and henna, olives and other fruits coming next.

<sup>(1)</sup> *Gli Annali dell'Africa Italiana*, 1st year, No. August 2, 1938. Ministry of Italian Africa, Rome. The census was carried out through the offices of the General Government of Libya, the Bureau of Studies of the Ministry of Italian Africa, and the Central Institute of Statistics of the Kingdom of Italy.

<sup>(2)</sup> By the Decree-law of January 9, 1939, No. 70, the four provinces of Libya were annexed to the territory of the Kingdom of Italy. At the same time, Libya retains its own legal character and its financial autonomy. On October 31, 1938 the population of Libya was 846,854, of which 76,894 were Italians and foreigners and 769,960 natives.

*Ginanal* are important in the more arid areas. Dry crops have to be used, the chief being olives and fruits, including grapes.

Among self-sown plants, *alfa* and *esparto* are important both being utilized for extracting cellulose.

As regards external trade, imports (in million lire) were 398.1 in 1935, 623.1 in 1936 and 623.3 in 1937; exports, 61.1, 107.7 and 122.4

Of the imports, 87 per cent, come from Italy and consist chiefly (177 million in 1937) of cattle, foodstuffs and tobacco; and (61 million) of textile fibres and their products, etc.

Exports go almost entirely to Italy and consist chiefly of raw hides, raw sponges and wheat.

### Colonization scheme.

By a royal decree of May 17, 1938 <sup>(1)</sup> Libya is to be colonized by forming small rural holdings. The Government is working out a plan for carrying out this colonization, and decides on the areas to be colonized, the number of farms in each area, and the type of farm best suited to the district. It will also undertake the formation of villages, or "rural centres", the building and maintenance of highways, of water-works, of telegraphic and telephonic communications, etc. Each rural centre must have premises for public services and public utilities, church, school and medical dispensary.

The Institute for the Colonization of Libya and the National Fascist Institute for Social Thrift decide on the distribution of lands and the constitution of small farms, the Libyan Government making free grants from the State territory of lands needed for this purpose. The two Institutes carry out the initial work of land and farm improvement in the 15 colonization districts, by erecting houses and farm buildings for the settlers, and works for supplying drinking water and water for irrigation, by clearing land and by providing the initial supplies of livestock and equipment.

For the five financial years 1937-38 to 1941-42 the Libyan Government will be granted an annual sum of 100 million lire to cover the expenditure arising from the above plan.

In applying this plan 1,800 Italian families, comprising 20,000 persons, have recently been settled in Libya. The majority of the colonists were chosen from small proprietors whose holdings in Italy were insufficient to guarantee subsistence; or from *métayers*; and in exceptional cases from agricultural labourers on condition that they had already been receiving as payment a share in the produce of the land (*compartecipazione*). The families chosen averaged 9 members.

The Libyan Government has equipped 3 villages and constructed 7 others to receive the colonists. The Tripolitanian coast received 1,000 families and the Cyrenaic Jebel 800.

Investigations undertaken during the last few years have shown that these areas are similar in certain respects to the areas from which the colonists came. They are suitable for arable farming and animal husbandry.

The land occupied by small farms is more than 53,000 hectares. and will undergo land and agricultural transformation over a period of from 2 to 3 years on the average, with a maximum of 5 years.

The setting up of the farms is financed entirely by the State, 30 per cent. being paid in money subsidies and 70 per cent. by credits. The loans are interest-free for the first five years; then interests at 2 per cent. is charged for three years. The capital

<sup>(1)</sup> *Gazzetta Ufficiale del Regno d'Italia*, No. 131, June 10, 1938.

will only be paid off from the ninth year, in 27 annual payments, including interest and amortization. The colonists must also pay a sum, amounting to not more than 1 per cent. of the cost of their own farms, towards general and administrative expenses.

Each farm is provided with a house containing three furnished rooms, with kitchen, shed, stable, pigsty and a well or cistern.

There are three types of farm. Firstly irrigated farms, numbering 410, situated in districts with an average rainfall not exceeding 150 mm. per annum. These have an area of 15 hectares, 10-12 hectares being irrigated, the rest dry. The chief crops will be wheat, leguminous plants and industrial plants (cotton, groundnut, hemp, etc.). The water for the 600 irrigated hectares is supplied from 16 artesian wells. Each well will supply 25-30 farms with a total irrigated area of 250-300 hectares and equipped with a network of canals. The livestock of each farm consists of 6 head of cattle and one mule.

Secondly there are the partly dry farms, numbering 338. They have a total area of 25-30 hectares, 5-6 hectares being irrigated and 20-25 dry. Here the average rainfall is 250-300 mm. The land is distributed between olives (12 hectares), almonds (5 hectares), grapes and olives (3 hectares), irrigated area (5 hectares). Of the last, 1-2 hectares are used for citrous fruits and the remainder for wheat, fodder plants, industrial crops, etc. Livestock is the same as for the first type.

The farms of the third type are not irrigated at all. They are situated in the regions with arid soils on the Tripolitanian and Cyrenaic plateaux, at an altitude varying between 300 and 800 metres. The lack of water for irrigation is compensated by a very abundant rainfall and other climatic factors. Rainfall varies between 300 mm. per annum near Tarhuna (Misurata) and 400 mm. in the Barce region. In the Cyrene area it reaches 600-700 mm.

There are 232 new farms on the Tripolitan plateau, with an average area of 50 hectares. The land is distributed between: (a) trees: olive trees (20 hectares), almond trees (7 hectares), olives and vines (5 hectares) and other fruit trees (0.5 hectares); (b) seed crops: 15 hectares. Livestock consists of 4 head of cattle and one mule.

The new farms on the Cyrenaic plateau, numbering 820, have an average area of 30 hectares, and the land is distributed between: (a) trees: olive trees (7 hectares), almond trees (2 hectares), vines (1 hectare), other fruit trees (0.5 hectares); (b) seed crops (19.5).

This region is the part of Libya best suited to the cultivation of cereals.

The livestock of each of the farms of this region consists of 6 head of cattle and one horse.

On taking possession of the farm the colonist found the land cleared and ready for ploughing for the autumn sowing. He was given a plough and other equipment and certain stores for his personal requirements.

At first the colonists will receive a monthly wage which will decrease proportionately as the farm becomes more productive. When the farm is producing fully, the colonists will be treated as *métayers* for a period of five years, the produce being shared with the Institute of Colonization. They will become owners of their land when the conditions of repayment provided for by the above mentioned decree have been fulfilled.

### Reorganization of farm credit.

Farm credit was reorganized by the Decree of May 13, 1937<sup>(1)</sup>, which distinguishes between credit for actual farming and credit for improvement. The first covers the ordinary management of farms which are already wholly or partly productive, and

---

<sup>(1)</sup> *Gazzetta Ufficiale*, No. 209, September 8, 1937.

in particular the handling and processing of products, the purchase of cattle, machines and farm implements and advances on farm products.

The second class of transactions relates to the permanent improvement of the land. The ends in view are (1) new planting and crops; (2) construction of farm roads; (3) preparation and improvement of land; (4) sinking of wells and establishment of watering-places and fencing; (5) construction and adaptation of rural buildings for farmers, housing livestock and equipment and storing and working up agricultural products; (6) construction of works for drinking and irrigation water and for draining and maintaining the lands; (7) application of electricity to agriculture, adaptation of mountain lands and reafforestation.

Loans for purchasing land to set up and improve small rural holdings are considered as farm credit operations.

The Decree of April 3, 1937 should also be mentioned, which permitted parcels of state land of from 4 to 15 hectares to be granted to native farmers in concession for improvement, the land being ultimately granted freehold. The native concessionnaires may receive subsidies from the colonial Government up to 40 per cent. of the cost of improvements on the lands granted.

Native owners of lands improved in accordance with the instructions given to native concessionnaires of domain lands may also receive these subsidies.

A Decree of August 12, 1937 <sup>(1)</sup> authorized the Savings Bank of Libya to increase its resources by issuing special bonds up to 400 million lire, thus ensuring it the funds required to carry out this plan of agricultural colonization.

## PORTUGAL

During the first ten months of 1938, the economic situation was much the same as for the corresponding period of 1937. In 1937 certain harvests, and especially the vintage, had been very abundant, while others, wheat, maize, rice, olive oil, had been only medium or poor. In consequence the position of agriculturalists was unsatisfactory: crop surpluses lowered prices to a level at which the grower made very little profit. On the other hand there was some rise in prices due to the small crops as indicated above, but the gross return was not enough to meet the costs of production and in particular the interest on debts. Taking it all round, the effects on the general national economy were unfavourable; thus the trade balance was weighted by the increase in imports and there was an exodus of foreign currency. In 1938 there was an abundant vintage, and the cereal harvests were more satisfactory.

The foreign trade figures for the first ten months of 1938 fall only a little below those of the corresponding period of 1937, which was a record year, and are higher than the figures of the three previous years:

### *Value of Foreign Trade for the First Ten Months of Years 1934-38:*

In thousands of escudos.

	Imports	Exports
1934 . . . . .	1,556,322	674,306
1935 . . . . .	1,601,825	719,674
1936 . . . . .	1,521,858	802,541
1937 . . . . .	1,772,811	970,558
1938 . . . . .	1,630,128	907,857

<sup>(1)</sup> *Gazzetta Ufficiale*, No. 236, October 9, 1937.

Agricultural exports represent 60 per cent. of the total exports; vine products hold the first place, and forest products the second, as Portugal exports large quantities of cork.

This improvement in trade has meant a progressive improvement in the financial situation. There were budget surpluses of 180,000 contos in 1936, 211,000 in 1937 and 200,000 in 1938.

The price index numbers of crop products, of animal products and of the cost of living during the last three years were as follows:

	Price index of crop products	Price index of animal products	General index of cost of living
1914 . . . . .	100	100	100
1936 . . . . .	2,011	2,051	2,022
1937 . . . . .	2,067	2,168	2,102
1938 . . . . .	1,907	2,115	1,962

All the index numbers thus fell during the first ten months of 1938; the average wages of farm workers, which stood at 7.30 escudos for men and 4.10 escudos for women in 1934, fell in 1938 to 7 and 4 escudos respectively.

## Wine.

There was large production of Portuguese wines, both of liqueur wines (Port and Madeira) and of ordinary red and white table wines: the vintage surpluses affected the interests of both vine-growers and of wine-dealers unfavourably. The measures previously taken by the Government to regulate the production, the consumption and the flourishing external trade in these products, were not adequate, owing to the very large production, for protecting the market; exports of wine decreased and prices fell. During the first ten months of 1937, exports amounted to 2,067,725 hectolitres representing a value of 208,195,000 escudos; for the corresponding period of 1938, the volume of exports was only 1,935,000 hectolitres for a value of 194,446,000 escudos. In reality there was no great difference between the two years, but in view of the very abundant vintage of 1938 the position of the vine-growers is not satisfactory, because together with some falling off in demand there is also an increase in unsaleable stocks; the result has been a price decline. To meet this situation the Government has regulated sales, laying down that these shall be in proportion to the wine obtained from the vintage in each case so that all growers may have a fair share of the market.

The main reason for the reduction in demand is to be found in the changes which have taken place on the European markets which consume Portuguese liqueur wines. In addition the ordinary table wines, formerly purchased by Brazil in large quantities, are no longer exported to that country; Brazilian buyers, who have to pay in gold, are not in a position to consign the required gold currency. Hence this type of wine has to be consumed in the country, and as the production is much in excess of the home requirements, there is a price decline.

In view of the importance of her great wine production for the general economy of Portugal, and since wine is the principal export commodity, the Government's policy is one of moderate limitation of production together with an endeavour to find new markets.

## Cereals.

*Wheat.* — The wheat market which was never satisfactory was rendered worse by the short crop of 1938. It became necessary to import almost one-fifth of the quantity required for home consumption, which is about 5,000,000 quintals: during the first ten months of 1938 the imports were precisely 842,299 quintals for a value of 83,000,000 escudos. This large importation was necessitated by the exhaustion of the stocks formed in 1935 and 1936, following on the harvest of 1937 which was also deficitary.

The Government's wheat policy is to increase the area under cultivation, not by rendering such increase compulsory but by fixing a remunerative scale of prices sufficient to encourage the farmer to extend his wheat-growing. With the same object the Government is improving the organisation of credit and is encouraging the use of selected seeds. All the enactments for giving effect to this policy are contained in the Decree No. 28,906 of August 11, 1938 together with a scale of prices in force from that date.

According as the specific weight ranges from 73 to 81, prices vary between 139 and 152 escudos for soft wheat and between 134 and 147 escudos for hard wheat.

The levy of 12 centavos per quintal harvested has been lowered to 2 centavos. In addition a large credit was opened, under the terms of the Decree, at the National Bread Institute for the purpose of making long term loans to farmers to meet the expenses of wheat-growing.

## Rice.

Portugal has always been an importer of rice; there has however been a decline in these imports in proportion to an extension of rice-growing. The measures taken by the Government, through the Regulating Commission for the Rice Trade which was set up in September 1934, were exceedingly effective. The annual average production of 230,000 quintals before the creation of this Commission rose to 570,000 quintals, average of the last four years. Actually the first measures taken by the Commission were designed to encourage growers to extend the area under cultivation, with the result that from an average of 10,000 hectares from 1931 to 1934, it rose to 20,000 in 1935 to 1938.

The beneficial results of the Government's measures are still more clearly evident from the import figures. The charge on the trade balance represented by the average import of 330,000 quintals of rice for the period 1931 to 1934 considerably declined as appears from the official import figures for 1937 and for the first ten months of 1938. In 1937 only 37,424 quintals were imported for a value of about 4,000,000 escudos, and for the first ten months of 1938, only 26,595 quintals for a value of 2,500,000 escudos.

This striking development is to be explained not only by the Government's measures, but also by the fact that higher profits accrue to Portuguese farmers from rice-growing than from the cultivation of other cereals; the very remunerative selling prices have continued to rise and the present market prices vary around 3 escudos per kilogramme for rice of first quality and 2.80 escudos for rice of second quality.

## Olive oil.

Since the formation of the National Oil Council at the end of 1937, the oil market has been brought under a system of planned economy. This step was taken by the Government with the object of increasing production and controlling extraction and thus preventing the sale of olive oils not entirely pure.

With a view to checking the sale at low prices of the new oil by small growers who are compelled to sell to meet the costs of production, the Government has placed at the disposal of the Council the sums required for granting credits up to a maximum of 350 escudos for each 100 litres of oil. The loans are at 6 per cent. interest, and amortisable in six months.

In consequence of the exceptional olive harvest of 1937, *viz.*, 970,600 quintals, or almost double the average of the last five years (543,000 quintals), the prices in October 1938 were lower than those of the corresponding month of 1937. But the very short new crop, which according to calculations is only about 350,000 quintals, will undoubtedly result in a rise in prices.

### WORLD AGRICULTURE IN RECOVERY AND RECESSION (1936-37 AND 1937-38)

*Below we give a brief outline of the contents of The World Agricultural Situation in 1936-37 and 1937-38 just published by the Institute in English, French and German. In the present article the reader will naturally find only brief indications of the principal developments of the period under review, and for statistical and other details he is referred to the volume.*

#### I. — Agricultural production and the supply of agricultural products.

The two years 1936-37 and 1937-38 have seen marked changes in the world agricultural production.

The year 1936-37 was the third in succession during which the world crops of the principal cereals were below the average. Stocks had to be drawn upon to make good the deficiency in current supplies. After the succession of good crops which lasted till 1933-34, and which had largely contributed to the agricultural depression of 1929-32, there began a succession of lean years. In 1933-1934, frosts and droughts reduced the principal cereal crops in the United States and in Canada and inflicted heavy damage upon stock and dairy farming in North America. But the losses there were compensated by good crops in other parts of the world. In 1934-35, the whole world was affected by the failure of the cereal crops; and the cotton crops were also poor in all the principal exporting countries—the United States, India and Egypt. Animal husbandry was also affected by the shortage of fodder. In 1935-36, weather conditions were again unfavourable to crops throughout the world. The cotton crops, however, were good, especially in Egypt. In 1936-37, weather conditions were again unfavourable to cereals, and most other food and fodder crops also suffered; especially in the so-called "importing" countries of Europe. The cotton crops, however, were again very good, and the production of cotton in new regions continued to expand.

The year 1937-38 marked a radical change in the situation as, in spite of adverse weather in some of the principal countries, it was a year of great plenty. This was partly due to the extension of the area sown, which, in some countries, was very considerable, and partly to high unit yield in those countries where weather conditions happened to be favorable. The world production of the principal cereals was abundant. As to cotton, both the area and the production of fibre in 1937-38 reached record figures.

As a result, while, during the preceding two or three years the stocks of the principal agricultural staples had been decreasing, in 1937-38 they began again to increase. This sudden change in the supply of agricultural products had a far-reaching effect upon agricultural prices and upon the world agricultural situation generally.

## II. — General economic background of the agricultural situation.

The economic revival, which was so marked a feature of the world situation in 1935-36, has since pursued a somewhat chequered course. Increasingly stimulated by rearmament, it developed into a typical boom during the autumn and winter of 1936-37; but in the spring of 1937 a reaction set in. The recession began in the United States and then spread over the greater part of the world.

### The upswing.

The autumn of 1936 was marked by an important monetary and economic event, the Tripartite Agreement of September 25, 1936 between France, Great Britain and the United States. The three Governments announced their intention to co-operate in the restoration of international economic relations, an essential condition of such co-operation being the devaluation of the French franc, with a view to bringing it into "alignment" with the currencies of the two other parties to the agreement.

Belgium was the first country to adhere to the agreement. Switzerland and the Netherlands followed immediately. Early in October Italy devalued the lira. Devaluations were also effected in Latvia and Czechoslovakia. The devaluation brought with it a tendency towards the mitigation of tariffs and trade restrictions, which was one of the objects of the Tripartite Agreement. This mitigation was made possible by the alignment of currencies, but it was largely dictated (in the devaluing countries) by the need to prevent an excessive rise in commodity prices and in the cost of living.

Though, in itself, devaluation could naturally exercise only a passing influence upon the economic situation, combined with other forces already in operation it gave a considerable impetus to economic expansion alike in the countries directly concerned and in the international field.

The deflationary pressure was largely eliminated, and a certain impulse was given to a rise in commodity prices, more particularly in those countries which had lagged behind in the general progress towards recovery. The reductions in tariffs and the removal or mitigation of trade restrictions gave some much needed encouragement to international trade, especially in raw materials and in foodstuffs.

All this contributed to the rise in commodity price and the rapid expansion in industrial and trading activities which distinguishes the last quarter of 1936. The rise in prices was not wholly due to the monetary change; there were other forces at work in the same sense. The world supply of the princi-

pal foodstuffs in 1936-37 was short of requirements, so that a rise in their prices was natural enough. Moreover, the crops having failed in some of the industrial countries of Europe, as well as in the United States, these countries had to increase their imports, thus contributing to the expansion of international trade in agricultural products. At the same time industrial expansion, largely due to accelerated rearmament, made increasing demands upon raw materials which had to be imported in larger quantities, thus tending to swell the turnover of international trade.

With the expansion of industrial activity and the rise in commodity prices, specially marked in the group of producers' goods, there was a strong inducement for the manufacturing industries and for speculators to build up reserves of raw materials against future contingencies. This, in its turn, tended to increase international trade in basic commodities and to raise their prices.

Through increased employment and higher wages, the aggregate purchasing capacity of the masses increased, and the inflationary tendencies inherent in the expansion came into operation.

Thus, in the course of the winter of 1936-37 the economic revival developed into a typical boom.

The industrial expansion, by increasing the demand for primary products, particularly benefited the agricultural and raw material producing countries. These increased their exports and obtained higher prices for their products, and the boom brought them large profits.

### **The recession.**

In the spring of 1937 signs of a change in the situation began to appear. A regression set in, giving rise to widespread fears of a fresh depression.

The rapid rise in commodity prices, backed as it was by inflationary influences, began to cause uneasiness in the United States, where it was feared that its progress would compromise the Federal Government's programme of industrial recovery.

The raising of the legal reserve requirements of the banks and the "sterilisation" of incoming gold which, being kept under lock and key, was not permitted to affect circulation, were resorted to in order to stop the inflation. Moreover, further deflation was achieved by a substantial diminution of Federal Budget expenditure.

The accentuation of deflationary tendencies in the United States after the raising of the legal reserve ratio of the banks and the declaration of the Federal Government's decision to combat inflation brought about the liquidation of speculative holdings in the principal products, and thus started a reaction in the United States and elsewhere.

Agricultural conditions also contributed to the reaction in prices. In the spring, when the prospects of the 1937 crops began to take more definite shape, and bountiful harvests were forecast in most parts of the world, there was a natural reaction in the prices of cereals and of other agricultural products. The reaction was particularly heavy in cotton.

In the United States the reaction began in April. In July prices recovered slightly under the influence of an expected revival of business due to exceptionally good crops and to the improved financial position of the farmers.

This rise in wholesale prices, however, was very short-lived, and a fresh reaction began in August.

In September, the month during which the prospects of the year's business in the United States generally take shape, the slackening in the booking of orders began to attract attention, and measures were taken with a view to reviving industrial activity.

The Federal Reserve Board reversed its deflationary policy, inaugurating a series of interventions by the Federal Government which, throughout the autumn, winter and spring of 1937-38, sought to revive industry and trade by the pumping of money into circulation and the creation of work for industries and the unemployed. These measures, however, were exceedingly slow in taking effect. The recession continued, though at a somewhat reduced rate, into the summer of 1938.

Then, in June a spectacular improvement on the stock market took place and signs of a change in business conditions in the United States began to appear. Since the summer of 1938, industrial activity in the United States has recovered considerably, but the agricultural depression has continued.

Though the effects of the recession in the United States were probably most clearly marked in Great Britain, practically all countries felt the impact of the American business slump to a greater or lesser extent. Even those countries which are making every effort in order to achieve economic independence from the rest of the world, have not been able completely to escape these influences.

Like the recovery of 1934-37, the recession in the first half of 1938 was practically world-wide, differing as between one country and another only in intensity.

In the "new" countries, dependent upon exports of foodstuffs and raw materials the effects of the recession have been very pronounced. The reaction in commodity prices, due to the recession and to bountiful harvests in 1937-38, brought about a considerable deterioration in their economic and financial position.

The immediate effect of these changes naturally affected the liquidity of the credit position of the "new" countries, which was to some degree restored during the preceding period of revival, and encouraged a recrudescence of trade restrictions.

### **Influence of general economic conditions upon agriculture.**

The nature of the revival in agriculture and the factors to which it was due have been discussed in some detail in *The World Agricultural Situation in 1935-36* (<sup>1</sup>). Among the recovery factors we singled out natural conditions, Government intervention and industrial expansion as the most important.

---

(<sup>1</sup>) *The World Agricultural Situation in 1935-36. The Factors of Recovery in World Agriculture*, pp. 21 sq.

The influence of the general economic revival upon agriculture was clear and needs little elaboration. Any complications that there were arose out of the nature of the industrial expansion, largely based upon two artificial factors: rearmament and Government intervention in favour of agriculture, which increased the purchasing capacity of the agricultural population. These were inflationary factors, making the revival precarious and necessitating a close watch over the situation; more particularly over the changes in the price-costs ratios in agriculture, as well as in other branches of production.

At the time when our last survey was being written, in the spring of 1937, the recession had not yet started, and the immediate outlook was for the continuance of an inflationary boom. Since then, the recession has of course changed the situation, if not perhaps so radically as might appear at first sight.

In considering the actual and potential effects of the present recession upon agriculture, and in comparing them with those of the last great depression of 1929-32, we should always bear in mind the profound structural changes which have taken place in agriculture since then. The depression of 1929 found agriculture still on the whole organised on competitive lines, both nationally and internationally. In spite of certain measures of protection, moderate by present standards, international trade in agricultural products was still conducted on the basis of relative costs. Everywhere agriculture responded to outside influences much more readily than it does now, when in most countries it is subject to deliberate planning and control behind elaborate defensive barriers of tariffs, quantitative restrictions and exchange regulations.

During the brief period of revival, Government intervention has not been abandoned, and agriculture entered into the present recession protected and controlled as never before. Accordingly, the various effects of the recession in agriculture are less clearly pronounced and less uniform than was the case in former depressions.

The general economic situation affects agriculture mainly through its influence upon the effective demand for foodstuffs and, particularly, for raw materials of agricultural origin. Apart from changes in supply and from monetary factors, the prices of agricultural products are mostly determined by the demands of industry and of the mass of consumers whose incomes are derived from industry and trade.

The effects of the increase in supplies, owing to the exceptionally good crops of 1937, should first be taken into account. The fall in agricultural prices should be only partly attributed to the recession, and to the consequent decline in actual or anticipated demand. Indeed, the recession, except in the United States, had not yet brought about any marked diminution in employment or earnings. Accordingly, in this phase, the forces working for a reduction of effective demand had not yet come into operation, at least in so far as foodstuffs were concerned. It was rather a case of increased supply on a market where the demand was static, with prospects of diminution. With regard to raw materials of agricultural origin, and particularly cotton, the situation was different. A reaction in the cotton industry, resulting in a reduced demand for

fibre, had set in in the spring of 1937. The record American crop of 1937 thus came on a falling market. The situation was further aggravated, since the beginning of the conflict in China, by the contraction of Japanese production of cotton goods, and of imports of fibre.

While the reaction in foodstuffs was mainly due to increased supplies, agricultural raw materials were sharing the fate of most other raw materials. Apart from the influence of supplies, which in the case of cotton was exceedingly important, the reaction in raw material prices was caused by declining demand, which, in its turn, while mainly due to the enormous contraction of industrial activity in the United States since the beginning of the recession, was partly accounted for by the shifts in the industries, accompanying the concentration of industrial resources upon rearmament and involving the shrinkage of certain branches of production. Finally, the current demand for raw materials has to some extent been met, since the beginning of the recession, out of the stocks laid in during the boom, in anticipation of a continued rise in prices and of eventual inflation. During the past twelve months or so, the existence of these stocks tended to restrict buying.

### III. — International economic relations.

#### Changes in international trade.

The economic revival which began in 1934 was very slow in making itself felt in international trade. It could hardly be otherwise in a world where economic self-sufficiency in essentials was becoming a watchword.

The political and economic situation of the world during the period under review favoured the progress of economic nationalism rather than a return to closer international co-operation. Far from improving, the international political situation deteriorated continually in 1936, 1937 and 1938. Military and political factors have tended increasingly to outweigh economic considerations.

A combination of special circumstances was thus needed to overcome the inertia of international exchange. The combination became operative in 1936-37.

Among the factors which stimulated international trade, the cumulative effects of the recovery in industrial production and earnings, which was by then in its third year, should be put first. The alignment of currencies in the autumn of 1936 and the subsequent relaxation of trade restrictions and exchange control, together with the effect upon commodity prices of the increase in gold supplies, all favoured an extension in international trade. The trade in agricultural products, in particular, increased owing to the failure of crops in North America and elsewhere. The United States, became an importer of cereals and greatly increased her imports of oils and fats while European imports of foodstuffs were larger than usual, as the crops were poor. Thus, by the time economic expansion reached the boom stage, in the late autumn and winter of 1936-37, international trade had also progressed considerably, making good much of the lag with which it had been following the expansion of industrial activity. In

1936-37 both the volume and the gold value of world's trade made great progress, reaching nearly the 1929 record.

As the recession spread over the world, international trade began to be increasingly affected. Old contracts, made during the boom, were running out, and the diminution of United States demand began to tell on the volume of trade, while its value was affected by falling prices. Outside the United States, the effect of large purchases of raw materials during the boom, in anticipation of rising prices, was that production was largely run on accumulated stocks. When these were exhausted, no restocking on a large scale took place, and purchases were made strictly within the limits of current needs, as is always the case on a falling market. The recession thus followed its natural course and its effects were cumulative. The process of contraction first became evident during the last quarter of 1937, continuing into the summer of 1938.

While the demand for raw materials, in spite of the exceedingly heavy consumption due to rearmament orders, has slackened considerably, the agricultural situation also helped to reduce international trade. Not only in the United States, but also in Europe, the 1937 crops were generally good, and the demand for imported foodstuffs diminished. Among the manufacturing industries, the textiles, and more particularly cotton, were less active, partly owing to the recession, partly as a result of the diversion of labour and means of production to the armament industries. In the United States, and to a lesser extent in the United Kingdom and Japan, there has been a decline in textile output, and the industrial consumption of cotton has fallen. Practically over the whole field of international trade, in spite of intensified rearmament, all the signs have been pointing to further contraction. Early in 1939, it would appear that this contraction has been checked, owing mainly to the revival in the United States.

### **Commercial policy during the revival and the recession.**

Commercial policy during the period under review generally followed the course which had been traced in the preceding few years. International economic relations were being reorganised to fit them into the framework of a world economy split into a large number of national economies planned and controlled independently. This involved a far-reaching transformation of the structure and operation of international economic intercourse. Competition was largely being replaced by bilateral contractual relations. Commercial policy reflected the struggle proceeding between economic nationalism, culminating in autarchy as an ideal, and international economic co-operation, involving a growing dependence of all the countries upon each other. In this struggle, as we have pointed out before, nationalism has so far been the winner, and in the recent evolution of commercial policy this was clearly reflected, in spite of certain steps toward freer trade which have been taken during the last two years.

Among the steps in this direction, the further progress in the carrying-out of the United States trade reciprocity programme, the Tripartite Monetary Agreement and the Oslo Agreement should first be mentioned.

Apart from these deliberate attempts at mitigating restrictions upon international trade, there were numerous isolated cases of reduction or abolition of such restrictions by autonomous national action. In these unilateral actions some are inclined to see evidence that the tendency towards international co-operation is successfully asserting itself against nationalism. If, however, we examine more closely the nature and extent of such apparent concessions to economic liberalism, we cannot fail to see that, however important they may be, these relaxations have nothing to do with the promotion of international co-operation.

Under such conditions, any movement towards freer international trade, even if for a time it found some encouragement in the upswing of economic activity, could hardly survive a recession. Once again, with the dwindling of demand and the fall in commodity prices, there has been a return to conditions resembling those which, during the depression, led to an outbreak of extreme protectionism.

Certain relaxations made during the boom with the object of assuring an adequate supply of raw materials for the armament industries, in anticipation of a possible shortage and of rising prices, were now abandoned. As the political situation had been going from bad to worse, economic nationalism was in the ascendant. The only notable exception was the continued negotiation of reciprocity agreements by the United States. The Oslo Agreement, which lapsed in the summer of 1938, has not been renewed. The numerous bilateral trade and clearing agreements signed during these last two years, furthering trade between the contracting parties and to that extent adding to the turnover of international trade, are essentially instruments of the modern contractual organisation of international economic relations.

Clearing agreements, however, have of late been assuming less restrictive forms leading to a certain redistribution of international trade, if not actually to an increase in its volume and value. This tendency consists in the increasing adoption of what had come to be known as "payments agreements" in substitution for clearing agreements proper. Under this system, originally adopted in the Anglo-German Payments Agreement in 1934, and applicable as a rule to trade between a country with exchange control and a country with free exchange, the former is free to dispose of the balance of the sums accruing to its credit in the latter, on condition that a specified proportion of these sums is spent on purchases from the importing country. Thus a certain freedom is allowed to the countries with controlled exchanges as regards the choice of the markets in which to buy.

Being accompanied by a tendency on the part of countries with controlled exchanges, whose trade is often diverted by clearing agreements into unnatural channels, to increase their intercourse with free exchange countries, this development may have a certain importance. It involves the return, within a limited scope, to triangular trade, which in the course of the last few years has been by way of being ousted by bilateral trade relations. The possible effects of this development upon the general future of international trade should not, however, be exaggerated, as under present conditions, it is frequently due to special circumstances.

Since the summer of 1937 there have been numerous cases of increasing import duties.

Apart from tariffs and direct restrictions upon imports, exchange control has a great influence upon international trade. Here also, the alignment of currencies and the general improvement in the economic situation before the recession, had brought about some relaxations, and in 1936-37 international trade was somewhat less handicapped in this respect. The recession, so far, cannot be said to have caused any general recrudescence of exchange control, though some countries have been compelled by special circumstances to tighten up their exchange regulations. This was particularly true of Latin America, owing to the deterioration of its trade balance.

In conclusion it may be said that the evolution of commercial and exchange policies proceeded empirically, particular situations being met as they arose. On balance, as is to be expected during a recession in economic activity and prices, the trend has been towards restriction. However, some developments in the other direction which originated during the revival, such as the United States reciprocity policy and the substitution of payment agreements for clearings, have continued.

### **Structural changes in international trade.**

In the course of the last few years the structure of international trade has changed profoundly.

On the one hand there has been a further extension of bilateral trade on a contractual basis at the expense of competitive international trade. Bilateralism, necessarily combined with a drastic restriction of free competition in international economic relations, is the outstanding characteristic of the new structural evolution of international trade.

The other aspect of the structural evolution of international trade during the period under review concerns the changes which have been taking place in the currents of trade between the different countries and continents.

As the most important and characteristic of these developments we should first mention the extension and consolidation of preferential economic relations between certain European industrial countries and their overseas empires; second, the constitution of certain regional economic blocs promoted by considerations of political and economic solidarity.

The two outstanding causes of the extension and consolidation of economic relations between European countries and their overseas empires are those of the British Commonwealth and of France and her possessions.

In the total of British trade the share of the Dominions increased continually at the expense of that of "other countries", and when in 1937 the turnover of the United Kingdom's trade at last showed a noticeable increase, the share of the Empire remained considerably above what it was in 1929.

The year 1937 was one of recovery for British trade, and the recession was not reflected in the turnover of the United Kingdom's foreign trade until the beginning of 1938. The decline in 1938, especially in exports, has been consi-

\* *Ec. 4 Ingl.*

derable. It is too early, however, to estimate the influence of the recession upon trade between the United Kingdom and the other countries of the Empire.

The share of French colonies and possessions in the total trade of France increased continually until 1937. In 1937, the share of the colonies in both French imports and exports diminished considerably. This was due partly to the increase in the trade with foreign countries, largely caused by rearmament needs, and partly to the effect of severe failures of crops upon the volume of exports from French North Africa.

The formation of regional blocs is one of the most important and characteristic developments of modern times, both economically and politically. The political geography of Europe was revolutionised by the Great War, and solutions have had to be sought for the many economic problems created by the redrawing of the political map. The position was particularly difficult in Central and Eastern Europe, where a vast network of new frontiers now cut across regions which in the past had for centuries been parts of the same economic body. Numerous schemes have been put forward and tried with a view to mitigating the situation, which in some cases proved practically unbearable. The economic depression, which was itself partly due to the dislocations produced by the War and the peace treaties in European economy, gave a powerful impetus to the movement towards regional economic agreements. The development in this direction was further stimulated by the rapid extension of national planning which was accompanied by an accentuation of the trend towards economic autarchy. The economic basis of the political and military power of the leading European countries had to be extended by regional understandings with neighbouring countries whose economic resources were complementary to their own. For the lasting success of such regional understandings it was essential that, apart from all considerations of political solidarity, the countries concerned should be able to supplement each other's deficiencies. The developments of these last few years have amply demonstrated the truth of this statement, and it is along these lines that the reorganisation of economic relations in Europe is now mainly proceeding.

Regional economic understandings have been embodied in formal agreements, bilateral or multilateral; or have been more or less implicit in schemes of political alliance or co-operation. To the latter type, based on political solidarity, belonged the economic co-operation since the depression between the members of the Little Entente—Czechoslovakia, Romania and Yugoslavia. This attempt at supplementing political with economic bonds failed, however, to solve the fundamental economic problem of the Little Entente—to dispose under favourable conditions of Romania's and Yugoslavia's large surplus of agricultural products. Economically, they could not help eventually being drawn into the orbits of other countries whose pull was stronger.

Somewhat similar was the case of the so-called Oslo group in Northern Europe, consisting of Sweden, Norway, Denmark, Finland, the Netherlands and the Belgo-Luxembourg Economic Union. All these countries have important political interests in common, and this inclines them to economic co-operation, which was attempted in the Oslo Agreement of 1937. The agreement was, on

the whole, unsuccessful and was allowed to lapse. Owing to the essential economic likeness of the signatories, their trade with each other is exceedingly limited and they are vitally dependent for both supplies and outlets upon their economic relations with countries outside the Agreement.

While some of the schemes of regional economic co-operation failed, because the countries concerned did not possess the requisite characteristics for such co-operation, a far-reaching process of economic reorientation has been going on in Central and South-Eastern Europe during the last few years. Two centres of economic gravitation have increasingly asserted themselves since the depression in this part of Europe, whose economy was profoundly dislocated by the territorial changes following the Great War. One of these two centres, whose power of attraction is particularly great and is supported by a long-standing tradition of commercial leadership in this region, is Germany. Her own economic requirements, as well as those of the agricultural and raw material exporting countries to the south-east of her, made the development of co-operation between them practically a necessity.

Under such conditions it was natural that the expansion and consolidation of Germany's economic relations in Central and South-Eastern Europe, should have begun as soon as that country, after 1925, recovered the control of her commercial policy. They were intensified after the depression, first by a system of bilateral trade agreements, and later by clearing arrangements.

The other centre of gravitation is Italy. Her influence has been spreading of late over the south-eastern countries of Europe, in the Balkans and the Near East. Although in consequence of Sanctions, trade relations with Italy suffered a setback in 1935 and 1936, particularly in the Balkans and the Levantine markets, in 1937 there was a certain recovery. Italy's position in the south, as a country with very considerable manufacturing industries in need both of raw materials and of markets, is much like that of Germany in the centre of Europe; the gravitational forces in operation in the two cases are essentially similar.

One of the most important developments in world trade during the last few years has been the change in its distribution between the different continents. This is due to numerous causes, the most important of which, in the long run, has been the course of economic development in different parts of the world. The aggravation of restrictions upon trade and of exchange control have also diverted international commerce into new channels.

The outstanding feature of the change in the inter-continental distribution of world trade since the depression has been the decline of the share of the two most industrially developed continents—Europe and North America—in the total turnover of commerce. Between 1929 and 1936 this decline was clearly marked. The accelerated rate of economic revival in 1936-37, culminating in the boom, had the effect of increasing the shares of both Europe and North America in world imports: a natural consequence of industrial expansion involving larger imports of primary products. This break in the downward trend of the share of these continents in world commerce, however, was entirely accounted for by the industrial boom, and it is not likely to bring about a reversal of trend.

It is very difficult, however, to draw any definite conclusions from any changes that may have taken place in the intercontinental distribution of trade during the period under review. Political conditions during the last two years have been so unsettled that trade currents were bound to be diverted from their normal channels. Thus, the present situation in the Far East obviously affects the trade of Asia, and by altering Asia's share in the total trade of the world unavoidably affects the shares of other continents as well. The effects of the protracted conflict in China are naturally cumulative, and in 1938 they were more pronounced than in the second half of 1937, immediately after the outbreak of hostilities.

In dealing with the intercontinental distribution of trade, we must therefore distinguish between the undercurrents of real change due to economic causes of a permanent character, and surface waves which—although sometimes violent—do not reach deep enough to alter the main tendency.

### World trade in agricultural products.

The depression of 1929-32 brought a great decrease in international trade in agricultural products. The world's net exports of wheat, for example, during the years 1933-34 to 1935-36 averaged barely two-thirds of the 1926-27 to 1930-31 average.

In 1936-37 *wheat* exports showed a marked increase, due to the influence of short crops in both the European importing countries and in the United States, this latter country, instead of exporting wheat, having been for three years running a large importer of that cereal. In 1937-38, with the United States having again a large exportable surplus, and the European crops being good, world wheat trade dropped again roughly to the low average of the three years preceding 1936-37. Among European importing countries, in 1936-37 and 1937-38, Germany occupied an outstanding position, her wheat imports having increased enormously as compared with the previous years.

The turnover of trade in *maize* increased considerably in 1937, the increase being due partly to larger production in Argentina, South Africa and Yugoslavia, partly to a great increase in the imports of the United States, where the crop was very poor, and an enormous increase of German imports. In 1938, Argentina's export surplus was under one-third of that of 1937, but the United States had a large surplus which, combined with those of Yugoslavia, Hungary and South Africa, partly made good the deficiency. Germany's imports continued to increase in 1938, thus helping to maintain the demand, but on the whole the world maize trade diminished compared with 1937.

Of other products, *agricultural raw materials* call for special mention. The cotton trade suffered from the recession in the United States and the conflict in the Far East, and the increased surplus of fibre came on a contracting market, with the result that, in 1936-37 and 1937-38, trade was slack and prices were depressed. The country which was most affected was India, whose cotton exports to Japan have greatly diminished since the beginning of the war in China. The United States share in the world's cotton exports increased considerably in 1937-

1938, mainly owing to the diminution of the exports of the two other principal exporters—India and Egypt.

Another product much affected by the industrial situation in the United States—especially by the revival and the subsequent recession—was *rubber*. To meet the growing demand in 1936-37, the International Rubber Committee, established in 1934 for the control of the world rubber market, raised the export quotas from 60 to 90 per cent. of the basic figures in 1937; but since the recession in the United States it had to make several successive reductions, and for the third quarter of 1938 the quotas were fixed at a low record of 45 per cent., in order to check the headlong decline in prices.

#### IV. — Agricultural prices and incomes.

##### Trend of agricultural prices.

In the table on the following page a comprehensive picture is given of the evolution of gold prices of the leading agricultural products during the more advanced phase of the recovery, the boom and the recession.

The effects upon agriculture of the revival and the subsequent recession are clearly seen from this table: in particular the change in the position of countries dependent upon their agricultural exports, in face of so rapid a reversal in the price situation. If the evolution in price relations since the recession is borne in mind, the seriousness of the situation becomes even clearer. Mainly owing to abundant production, the decline in agricultural prices since the recession was more pronounced than that in the prices of manufactured goods and of services, so that the terms of trade turned heavily against the agricultural exporter.

The country where the change was particularly marked, was the United States. The change from the situation in 1936-37, culminating in the boom, to that of 1937-38, after the recession and the complete reversal of the agricultural balance, was reflected in the passing of the Agricultural Adjustment Act of 1938, which has for its object the solution of the same problems of over-production and of the "farmer's dollar" as the original A. A. A. of 1933. These problems had for a time, owing largely to natural conditions, lost much of their urgency; now they again came to the fore.

Most Latin American countries were suddenly faced with a deterioration of their trade balances, and had recourse to stricter control of imports and exchange dealings.

For the agricultural exporting countries of Europe, the position was somewhat eased by the continuous development of their contractual trade relations, and some of them, in spite of the general recession, closed the agricultural year 1937-38 with a balance on the right side.

The operation of the various schemes of international regulation of the market of certain commodities, also reflected the change from revival to recession. This was the case particularly with rubber, the export quotas having

been halved during 1937-38, to meet the fall in United States demand. The international control of the wheat market had been in abeyance for over two years, but in 1937-38 a movement was set on foot for its revival. The International Sugar Agreement signed in London in May 1937, just at the beginning of the recession, was apparently effective in improving the conditions of the world sugar market in 1937, but in 1938 prices collapsed again, and by the close of the agricultural year 1937-38, export quotas were reduced considerably.

In the principal importing countries the measures of control were not generally abandoned during the revival, so that the recession did not involve, as a rule, any drastic revision of policy. The behaviour of wheat prices in Germany and, to a lesser extent, in France and in Italy deserves, however, special attention. Germany stands out as the country in which the economic system is most thoroughly controlled. The German market for agricultural products is virtually isolated, and the price system is as nearly autonomous as possible. The prices of certain basic farm products, including wheat, are fixed according to regions. The outstanding characteristic of the evolution of wheat prices in Germany—and wheat may be taken as typical in this respect—is their extraordinary stability throughout a period of wide variations on the world market. The changes that took place were slight, and often in a sense contrary to the changes in world prices.

In France wheat prices in 1935 were still much above the world level, though the margin had narrowed down. They rose at the end of 1935, and in 1936; but after the devaluation in September 1936, the trend of gold prices diverged sharply from that of nominal prices, and while the latter increased rapidly, the former declined, because the rise in internal prices failed to keep pace with the specific depreciation of the currency.

The movement of wheat prices in Italy was also influenced by the reorganisation of marketing through the *ammassi* which took place in the summer of 1936, and by the alignment of the lira in October of that year. While nominal prices have been rising slowly, but continually, since the autumn of 1935, gold prices dropped sharply at the end of 1936. Since then, owing to the strict control of the rate of exchange of the currency, they have varied within relatively narrow limits.

The examination of the movement of gold prices of the principal agricultural products also reveals the extent to which certain countries, by means of an active market and prices policy, have succeeded in making their price systems independent of outside influences.

The few deviations from the general trend in the exporting countries, of which the rise in the prices of oats in Argentina in 1938 is an example, are generally due to short crops or other local causes. In the case of some particular commodities, the market in which is subject to effective control, prices may also have deviated from the general trend; but these cases are exceptions which confirm the rule. The trend of agricultural prices on the world market was unmistakable.

The cases in which the course of gold prices diverged from that in national paper money were practically confined to the countries in which there has been a devaluation in 1936; and even in these—with the exception of France, where the franc continued to depreciate, after a sharp fall following the devaluation—gold and nominal prices generally moved on parallel lines. In some South-American countries there have been momentary deviations due to variations in the trade balance, but, as a rule, they have been more or less promptly corrected by tightening up the control over trade and exchanges. With the rates of exchange relatively stable since the sudden dislocations produced in

the autumn of 1936 by the sequence of devaluations, gold prices during the years 1936-37 and 1937-38 could be considered sufficiently representative of the general price trend of the world market to dispense us from the necessity of making a detailed examination of the movements of prices in national currencies, which would be bound to reproduce very much the same picture. Accordingly, we shall merely give a table of quarterly index numbers of wholesale prices of agricultural products in those countries for which such indices are available.

*Quarterly General Index-numbers of Prices of Agricultural Products.*

<sup>(1)</sup> Base: 1st quarter of 1932 = 100. <sup>(2)</sup> Base: 1st quarter of 1931 = 100. <sup>(3)</sup> First month of each quarter compared with January 1929.

The decline, according to these indices, is most pronounced in the United States, Argentina and Canada.

In Europe, price trends were less uniform. In Germany there was stability. In England, the maximum was reached during the second quarter of 1937, since when there has been a steady decline.

In the Netherlands, where a far-reaching system of regulation and control of agricultural markets, put in operation during the depression, has not been abandoned, the index numbers rose continually till the third quarter of

1937. There was then a reaction in the next six months, but in the second quarter of 1938 a recovery took place. In Sweden, prices improved almost continuously till the second quarter of 1938, when there was a slight setback, probably due to the recession, which had been late in making itself felt in the Scandinavian countries, but which, in 1938, reached them also. In the agricultural countries of Eastern and South-Eastern Europe, where economic conditions during the period under review were determined more by regional factors than by developments on the world market, the price trends were somewhat peculiar. In Hungary, there was a slight reaction in the second quarter of 1937, but there has since been a continuous recovery. In Poland the reaction which began at the end of 1937, has been relatively slight. In Yugoslavia recovery has been practically continuous, and was particularly marked in vegetable products. In all these countries prices had fallen to exceedingly low levels during the depression, and the development, in the course of the last few years, of their exchanges on the basis of bilateral trade and clearing agreements with their industrial neighbours more than compensated them for the effects of the general recession.

Two countries do not appear in our table, though the movements of agricultural prices in both present considerable interest. In France, agricultural prices advanced rapidly until September 1937. Between September 1937 and March 1938 the movement came practically to a standstill. During the second quarter of 1938, there was a decline in animal products, coupled with a considerable rise in vegetable products. In Italy the steady rise in agricultural prices, largely owing to active Government support, has been practically continuous since 1934.

### Agricultural prices and costs.

During a period of rapid changes in prices, considerable ruptures in the balance of prices of different commodities are unavoidable. Agriculture is more liable than most other branches of production to suffer from such upheavals, being more difficult to organize. Hence, during the great depression of 1929-1932, governments had to intervene in favour of the farmers, either doing for them, or making them do, under some compulsory scheme of control, what most industries did through voluntary combination for the regulation of production and prices. This intervention, to which agriculture was largely indebted for its recovery, has not generally been abandoned during the period of rising prices, and since the recession the measures of regulation and control have often been intensified. Accordingly, when the fresh reaction in prices began, the farmers in most countries were better able to cope with the situation than in 1929, when the depression took them utterly unprepared and played havoc with their markets and their incomes. This difference in the farmer's position, which involves to a certain extent the recognition of the special position of agriculture as a public service, is exceedingly important, and has always to be borne in mind in considering present-day agricultural problems. In most countries, agricultural prices are not what they were in 1929. Then they were merely what the farmer could obtain in competition on the open market, now they are often conceived of as his just remuneration for performing a function of special social utility, the

continued performance of which must be assured, if necessary at a certain expense to the community as a whole. Whatever the differences in form, such is the substance of the agricultural price policies of the New Deal in the United States, with its "parity prices" and its "farmer's dollar"; of National-Socialist Germany with her fixed "fair" prices of agricultural products; of the Wheat Act

FIG. 1. — Movement of prices of agricultural products and of articles bought by the farmers and of agricultural wages in the United States (1909-10 to 1913-14 = 100).

FIG. 2. — Movement of prices of agricultural products, of feeding stuffs and of chemical fertilisers in England and Wales (1911-1913 = 100).

and the marketing schemes in Great Britain; of the *Office National du Blé* in France, etc. Under all these different schemes, agriculture is to a larger or smaller extent withdrawn from the competitive struggle of the market and placed in a sheltered position, under the care and tutelage of the State.

Under such conditions the prices of agricultural products, except in countries depending entirely on exports and therefore unable to support them by national measures for any considerable time without incurring enormous losses, are bound to display far greater stability than they did under competitive conditions, such as existed in 1929.

Government intervention was not limited to control of the prices of agricultural products, but often involved measures aimed at the reduction of costs of

production as well. This was specially important in countries which, being dependent on the world market for the disposal of their products, could exercise no effective control over prices, and thus had to intervene at the other end. In some so-called importing countries this was a necessary adjunct to the price policy, in so far as, in the interest of the economic system as a whole, agricultural prices could not be raised.

Moreover, since our last survey was written, important changes have taken place in the general economic situation.

The recession, though it involved a decline in agricultural prices, greatly eased the situation with regard to costs of production. With the falling-off of United States demand for primary products, the strain to which rearmament subjected the raw material markets was considerably relieved, and the threatened dearth of the means of production necessary to the farmer had on the whole not materialised. The pitch to which the tension in the economic system rose in the spring of 1937 has not been maintained, and in spite of the depression of prices the agricultural situation became far less dangerous, than it then appeared.

Passing now to the examination of changes in the relation of agricultural and industrial prices it is necessary to point to the unavoidably crude approximation with which our data reproduce the actual situation. Failing anything better, they do however give an idea of the direction of changes in some at least of the principal items of the farmer's costs, compared with his returns.

In the table on the next page we show the movement of index-numbers from the beginning of the recovery to 1937. From these annual figures we shall pass to a brief survey of quarterly indices.

With the single exception of Germany in which both the prices of agricultural products and those of the principal commodities bought by the farmer displayed great stability throughout the later stages of the revival and the reces-

<sup>(1)</sup> In Norway and Finland for the agricultural year beginning on April 1st.

sion, in 1936 and, still more, in 1937 the prices of agricultural products registered a marked rise. Dealing here with general index numbers, in which the individual variations are hidden, one is liable to underestimate the extent of the disequilibria which, particularly during the later stages of the revival, began to develop within the price system. These ruptures of balance between the prices of individual commodities are only occasionally reflected in our table.

It is only in 1937, a year which saw the boom reach its climax and the recession begin, followed by the large increase in the supply of agricultural products owing to plentiful crops, that—in spite of the rise in the index-numbers of agricultural prices—signs of the balance becoming upset began to appear. This reflects the fact that the advance in the annual index of agricultural prices is often entirely accounted for by the months preceding the boom, after which there has been a more or less pronounced reaction; a reaction more marked in farm products than in any of the commodities or the services farmers buy.

We see that, in the *United States*, the rise in the agricultural price index in 1937, though marked, is almost overtaken by that in commodities bought, which used to lag considerably behind it since 1934, and that agricultural wages have advanced by nearly twice as much as farm products. Indeed, if we consider the trend of the three series, as plotted in the diagram No. 1, we see how, since the recession, price relations turned against the farmer.

In *England*, where animal husbandry is the most important branch of farming, and where fodder costs therefore play a decisive part in the farmer's balance of profit and loss, the characteristic development of the period under review

FIG. 4. — Movement of prices of agricultural products and of costs of production in Belgium (1909-1914 = 100).

was the rise in the prices of feeding stuffs, which is shown in diagram No. 2 in relation to the movement of prices of agricultural products.

FIG. 5. — Movement of prices of agricultural products and of articles bought by the farmers in Sweden (1909-1913 = 100).

diagram No. 4, and at a greater pace than did prices, so that the farmer's position would appear to have somewhat deteriorated.

In *Sweden* the price situation has on the whole been distinctly favourable to the farmer. Indeed, even during the depression, Sweden was never affected as much as most other countries. During the period under review agricultural prices rose almost uninterruptedly until the first quarter of 1938, and only in the second quarter of that year was there a reaction. The prices of commodities bought by farmers also rose, but to a somewhat lesser extent, and they also reacted in the second quarter of 1938, but less than did agricultural prices.

In *Poland* the trend of agricultural prices was upwards till the third quarter of 1937. Since then there has been a slight decline. The index of prices

The position in *Germany* during the period under review shows a combination of great stability in the prices of agricultural products with a progressive rise in the general index of prices of finished industrial products. The position of the farmers, in face of this depreciation of their products relatively to manufactured goods, was however considerably mitigated by the effective control of the prices of the principal means of agricultural production—fertilisers and implements—the cost of which actually fell.

In *Belgium* the general trend of agricultural prices has been upwards, though seasonal and other fluctuations were sometimes rather pronounced. In the first half of 1938 there was a slight reaction. The index of costs of production rose continually throughout the 30 months covered by

FIG. 6. — Movement of prices of agricultural products and of articles bought by the farmers in Poland (1928 = 100).

of commodities bought by the farmers displayed remarkable stability, so that, on the whole, the farmers' purchasing capacity ought to have increased. Indeed, in Poland the Government was not called upon during the period under review to take any special measures for the control of agricultural markets and prices, and its activity was focussed upon schemes of permanent improvement in agriculture. It should also be noted that Poland is among the few countries which have stuck to gold parity, and that the working of this deflationary factor upon its price system has been to smooth down any tendency towards a rise in commodity prices.

In *Yugoslavia* there has been a rising price trend since the second half of 1936. This rise is very pronounced in vegetable products, but in animal products much less marked and rather unsteady. The prices of industrial products rose considerably, though much less than those of vegetable products, but in 1938 there has been a slight reaction. The situation during the period under review developed on the whole favourably for Yugoslav agriculture.

### Returns of agriculture.

As we have seen, during the two years covered by the present survey both the volume of agricultural production and the prices of agricultural products underwent drastic changes. In the present section we shall make an attempt, on the basis of the few and fragmentary data available, to estimate the effects of these changes upon the economic position of agriculture.

In the *United States*, the cash farm income of farmers has increased continually since 1933. Up to 1936, this increase was mostly due to a rise in prices due to the joint effects of the New Deal and of short crops. In 1937, in spite of the reaction in prices, the increase in the volume of sales due to abundant crops and a slight increase in Government payments under the Soil Conservation Act brought about a considerable rise in farm income. According to the preliminary estimate for 1938, it would appear that the continued reaction in prices, aggravated by the repetition of bountiful crops, reduced the farmers' income considerably, despite a fresh increase in the volume of sales. The total cash income of farmers in the United States, including Government payments, in millions of dollars, was: 5,117 in 1933; 6,378 in 1934; 7,090 in 1935; 7,944 in 1936 and 8,600 in 1937. In 1938 it is provisionally estimated at 7,500 million dollars.

FIG. 7. — Movement of prices of agricultural products and of industrial products in Yugoslavia (1925 = 100).

In *Germany*, the income of agriculture has increased continually since 1932-1933, when it was at its lowest with 6.4 milliards RM. In 1936-37 it was 8.9 milliards, and in 1937-38 reached 9.5 milliards, the increase being due almost entirely to an expansion of production and sales.

For some countries we possess estimates of the net value of total agricultural production. In *Canada*, the net value of agricultural production, which reached 1,020 million Canadian dollars in 1920, and fell to a minimum of 493 million dollars in 1932, had since been rising continually, until in 1936 it reached 690 million dollars. In 1937 however it dropped to 682 million dollars, as a result of the great drought of that year. In *Switzerland*, the net value of agricultural production which, in 1936, had fallen to 1,146 million Swiss francs, increased to 1,247 million francs in 1937.

For *Sweden* we possess figures for the gross value of agricultural production. After a period of depression from 1930 to 1933, the gross value of agricultural production has very nearly returned to the figure of 1929, the variations from year to year in 1934, 1935 and 1936 being slight. In 1936, the figure was 1,029 million Swedish crowns and in 1937 it rose to 1,183 millions: a figure considerably in excess of 1929 (1,059 millions).

The above rather scanty data have the great drawback of telling us nothing about the actual economic position of the farmer, since, while they show how much he obtains for his products, they are completely silent about his costs. From that point of view, the most interesting source of information consists in the results of *farm accountancy*, provided they are statistically representative and sufficiently recent. For the purpose of our present study, however, which is to show the changes in the economic position of agriculture in various countries owing to the recession, practically nothing has been published as yet. Indeed, for the crucial year 1937-38, the results of farm accountancy are available at the moment of writing for *Denmark* only. The data published by the Danish Bureau of Farm Management show that the net returns of controlled farms, which were 78 crowns per hectare in 1934-35 and 93 crowns in 1935-36, fell to 52 crowns in 1936-37 and rose again to 91 crowns in 1937-38. Farm expenses increased from 564 crowns per hectare in 1936-37 to 594 crowns per hectare in 1937-38, the rise being chiefly due to higher cost of labour and of feeding stuffs. The gross returns increased from 616 crowns in 1936-37 to 685 crowns per hectare in 1937-38. The only other data available for 1937-38 are for the Overijssel district in the *Netherlands*, also rather a peculiar case. There, the net returns of controlled farms increased from 27.98 florins per hectare in 1936-37 to 42.78 florins in 1937-38.

For other countries our information reaches only to 1936-37, covering only the recovery phase. It generally reflects the improvement which had been taking place practically everywhere before the sudden reaction in 1937. Thus, we see that, in *Switzerland*, the net returns of all farms, as estimated by the Secretariat of the Swiss Peasants' Union at Brugg on the basis of farm accountancy data, has increased continually since 1933-34, passing from 214 to 256 Swiss francs per hectare between 1935-36 and 1936-37. In this case, unlike most other cases the increase in net returns, was entirely accounted for by a diminution

of farm expenses. In *France*, the increase in the net return of controlled farms in the Soisson district was from 284.67 francs in 1935-36 to 565.47 francs in 1936-1937, and in Etrepagny from 242.69 to 429.23 francs per hectare; but here the depreciation of the franc should be taken into account. In *Estonia* we have an increase in net returns from 11.03 Estonian crowns per hectare in 1936-37 to 15.80 crowns in 1936-37; in *Poland* from 52.82 to 63.14 zloty per hectare. In *Sweden*, the net returns of controlled farms of the Central region increased from 51 Swedish crowns in 1935-36 to 52 crowns per hectare in 1936-37. In Southern Sweden the increase in net returns was from 124 to 131 crowns per hectare. In both regions farm expenses increased. In *Norway*, the increase in net returns of peasant farms was from 101.9 Norwegian crowns in 1935-36 to 115.2 crowns per hectare in 1936-37.

## V. — Agricultural policies in the different countries.

The last chapter of our volume deals with the agricultural policies followed in the different countries during the period under review. It would obviously be impossible to give here even a brief outline of the main trends of the evolution of the national policies, which are peculiar to each country, but some of the outstanding characteristics of the policies followed may be mentioned here.

One feature of the trend of agricultural policy during the two years dealt with in our survey, to which we have already had occasion to point, and which played a very important part in the situation, was that the far-reaching measures of government intervention, to which agriculture has been subject practically everywhere since the depression of 1929-32, have generally survived during the recovery, with but very few relaxations. It could hardly have been otherwise, seeing that the revival in agriculture has been due to a very large extent to these measures of government intervention, and that, once put into operation, they penetrated so deep into the whole structure of agricultural production and trade that they could not easily be withdrawn without throwing the whole agricultural sector of the economic system into utter confusion. Accordingly, when the recession came, it did not generally necessitate the adoption of new measures of intervention or the creation of new machinery of control; and though national policies naturally differ according to the special conditions of the countries concerned, as well as to the leading principles of the general economic policy followed by their respective governments, this applies indifferently to them all.

The recession, indeed, during the period under review, has not produced anything essentially new in agricultural policy.

The only exception to this is provided by the United States in the *Agricultural Adjustment Act of 1938*, but even here it is more apparent than real. Indeed, the new Act put into effect an agricultural policy of a more permanent nature than that inaugurated in 1933; a policy which has been envisaged ever since the beginning of the New Deal. The recession may have accelerated the passage of this enactment by once again forcibly focusing attention upon the

precariousness of the position of the farmers, but all the main points of the scheme embodied in the Act have been under consideration for a considerable time past.

Another feature of the reaction of national agricultural policies to the recession was that such reaction, hardly noticeable anywhere, was least of all marked in those countries which have deliberately adopted the system of comprehensive economic planning and control. In these countries, of which Germany and Italy are the two outstanding examples, the control of production and trade makes the home market to a large extent independent of the changes which take place in the rest of the world. As we had occasion to see, this independence was clearly evident in the evolution of prices of agricultural products in these countries throughout the recovery and the subsequent recession. Isolated, as far as possible, from outside, these countries did not feel the impact of the recession to anything like the extent to which it was felt in other countries, more open to the influences from the world market, and their policy, accordingly, remained unchanged and followed its appointed course.

The countries in which the recession was most painfully felt were the overseas agricultural exporting countries. Their exports depreciated heavily, and there was very little they could do by their own national efforts to meet the situation. Practically the only way open to them was the tightening-up of restrictions upon imports and of exchange control, by which they could at least try to prevent an unfavourable turn in their balance of trade and of payments. This, indeed, was the means widely applied by the countries of Latin America—Argentina, Brazil and some other of the South-American Republics.

In some cases, the agricultural exporting countries sought to remedy the situation by having recourse to international action. Thus, in 1938, there began a movement in favour of the revival of the International Wheat Agreement, which had been in abeyance since the beginning of the recovery, and in January 1939 a conference met in London with this object in view. The export quotas fixed by the existing international bodies for sugar and rubber, which have been raised during the boom, were again heavily reduced in 1938. But these international actions covered a very limited field, and as autonomous national action was also seldom effective, the situation of these countries was difficult.

The agricultural exporting countries of Europe, during the period under review have not, on the whole, suffered from the recession to any considerable extent. As a result, whatever changes there may have been in their agricultural policies were mostly accounted for by considerations of permanent improvement in the organisation of agriculture, as distinguished from emergency measures. The fact that they were so little affected by the recession, while the depression of 1929-32 had all but ruined them completely, was mostly due to the enormous development, in the course of the last few years, of bilateral trade agreements which ensured to the agricultural countries of Eastern and South-Eastern Europe profitable markets for their exportable surpluses. In some cases, these agreements actually involved a more or less far-reaching re-orientation of agricultural

production in the countries concerned. During the period under review the development of bilateral agreements in Eastern and South-Eastern Europe played an exceedingly important part and was, probably, the outstanding feature of the whole evolution of agricultural policy in this vast region.

Of the other countries there is little to say, since, as we have pointed out, on the whole they continued to follow their different policies, generally marked by far-reaching government intervention, along the lines described in considerable detail in the preceding volumes of our survey. France, however, should be mentioned here, as her agricultural position and policy has been profoundly affected by the continuous depreciation of the franc. The movement of prices due to monetary conditions could not fail to exercise an influence upon the activity of the *Office National du Blé* which had to adopt its policy to changing conditions. But, on the whole, the depreciation of the franc, and the consequent rise in commodity prices, benefited the farmer, and consequently facilitated the task of the Government in assisting agriculture.

G. P.

## TRADE RELATIONS OF THE U. S. S. R. WITH WORLD AGRICULTURAL MARKETS

SUMMARY: — General features of the foreign trade of the U. S. S. R. — Trade treaties between the U. S. S. R. and other countries. — Volume and character of the foreign trade of the U. S. S. R. — Alteration in the composition of Russian foreign trade.

### I. — General features of foreign trade of the U. S. S. R.

#### The State Monopoly of Foreign Trade.

The lines along which the Russian planned economy was to develop its economic relations with the outside world found expression as early as April 22, 1918 in the formation of the State Monopoly of Foreign Trade. In 1922 this organization was given its legal place as an integral part of the economic system, through the Civil Code. Clause Seventeen stated that "no person or juridical person in the territories of the R. S. F. S. R. <sup>(1)</sup> shall take part in foreign trade except through the agency of the State as represented by the People's Commissariat for Foreign Trade. Independent dealings on the foreign market are permissible only in circumstances expressly defined by the law, and then only under the supervision of the People's Commissariat for Foreign Trade".

---

<sup>(1)</sup> Russian Socialist Federation of Soviet Republics. It may be mentioned here that the Union of Socialist Soviet Republics (U. S. S. R.) was organized on July 6, 1923 as a free union of Soviet Republics, of which there were originally four, the largest being the R. S. F. S. R.

In the years immediately after the war Russia's output fell off considerably, and industry could only be supplied with raw materials by requiring for raw material exports special permits, issued by a particular Government organization in each separate case. In addition, an adequate market for home products had to be guaranteed, and this consideration, in view of the great fall in purchasing power on the home market, made it necessary to restrict imports more or less completely. Thus both exports and imports required regulating. This was done through a plan drawn up by the State Planning Organization and rigorously applied by the State Trade Monopoly.

The rapid depreciation of the rouble had also to be checked. One of the essential requirements in solving this problem was the prevention of exports of specie, which meant that the balance of trade would have to be made favourable. This supplied a further reason for introducing and maintaining a monopoly of foreign trade.

This monopoly of foreign trade aims at checking unregulated trade with foreign countries and preventing the developing socialist economy from being submerged by goods from other countries. In the opinion of the Russian planners, tariffs alone were scarcely adequate to achieve this object, as even the very highest tariffs could be compensated by high bounties on goods exported to the U. S. S. R.

The guiding principle of the U. S. S. R.'s tariff policy is the protection of industry, and particularly heavy industry. Nevertheless, as a result of the monopoly system tariffs play a less decisive role in the U. S. S. R. than in other countries. The principal means of protecting industry internally are the prohibition of the purchase of certain articles and the refusal to grant licences. The same policy is adopted in regard to foreign trade: the import of goods produced in sufficient quantities within the country is not permitted. On the other hand, if the output of certain goods within the country is inadequate they may be imported despite the home output.

Under the Russian planning system, at the beginning of each year a detailed plan of the balance of payments is drawn up which provides for the imports required to supply the population and the sums needed to cover financial obligations. On the basis of this estimate the total quantity of exports is calculated. The composition of these exports is decided on after a careful study of the position of the export markets.

The various import and export organizations of the People's Commissariat for Foreign Trade are financially self-supporting. They enjoy the rights of a juridical person. Among the export associations for agricultural products may be mentioned the *Exportchleb*, founded in 1923, a special organization which the State entrusted with the monopoly of exports of cereals, the *Exportljon*, an organization for the export of flax and hemp fibres; the *Exportles*, founded in 1926 for the export of wood; the *Puschosyndicat* for the export of furs etc. There are similar organizations for the various imports. They deal with the import (and sometimes also export) trade along the lines laid down by the plan after confirmation from the People's Commissariat for Foreign Trade.

The basic principle that foreign trade should be conducted by the State has not so far been modified. Article 14 of the New Constitution of the end of 1936

cites foreign trade based on a State Monopoly as coming within the competence of the supreme power of the U. S. S. R.

In so far as the new social order eliminated the free play of private enterprise it involved the planning of the whole economic activity of the country. And this required in particular a State monopoly of foreign trade. The regulation of economic relations with the outside world was a necessary complement to the regulation of the whole internal economic activity.

### Trade treaties between the U. S. S. R. and other countries.

In the first few years after the raising of the economic blockade against the Soviet Republic foreign trade was to a large extent more or less fortuitous. The first trade treaties were only concluded after the introduction of the "new economic policy" (N. E. P.) in 1921.

The first treaties were extremely involved because the negotiators represented countries whose constitutions and economic systems differed fundamentally. A *modus vivendi* for economic cooperation was only found slowly.

The principles of the U. S. S. R. foreign trade monopoly were made the basis for her foreign trade agreements.

Trade treaties between the U. S. S. R. and other States are almost all, as has been the practice in other international trade treaties for over a century, based on the most favoured nation clause. Every preferential tariff granted by one country to another country is automatically applied to the U. S. S. R. as well.

Naturally we cannot enumerate here all the trade treaties concluded by the U. S. S. R. with other countries during the twenty years of her existence, much less undertake a detailed study. Here we shall confine ourselves to outlining the main characteristics of the Soviet Union's foreign trade policy as shown by her principal trade treaties.

On February 7, 1924 the U. S. S. R. concluded a trade treaty with *Italy*—the first Russian trade treaty, and the first expression of the Soviet's foreign trade policy. Trade agreements preceding this treaty, such as those with Austria, the United Kingdom, Norway, Denmark and Italy herself (in 1921) were no more than declarations describing the lines along which future trade relations would be developed.

The treaty with Italy is in the case of nearly every commodity based on the most favoured nation clause, though, as in most other Russian trade treaties, this clause does not extend to the privileges conceded by the U. S. S. R. to the Baltic countries (Estonia, Latvia and Lithuania) and the Eastern countries (Iran, Mongolia, etc.).

The principles formulated in this treaty influenced the later practice of the U. S. S. R. in foreign trade and appeared in some form in all subsequent trade treaties of the U. S. S. R.

A customs convention was signed at the same time as the trade treaty, and this conceded reciprocal tariff reductions on the most important Italian and

Russian export items. The tariff convention, however, did not lay down the general principle of the most favoured nation clause for trade relations between the U. S. S. R. and Italy, but confined its application to specific goods.

On May 6, 1933 the convention of February 7, 1924 was replaced by a new tariff agreement based on the principle of most favoured nation treatment for all goods.

To increase Russian imports from Italy the Italian Government granted guarantee credits amounting to 75 per cent. of the Russian orders to Italian business houses for their export business with the U. S. S. R. These credits amounted in all to nearly 1 milliard lire (950 millions) and were paid back shortly after the dates fixed. The Credit Agreement signed on June 15, 1935 established fixed quotas for imports of Soviet goods into Italy, which for the most part were to correspond with the level of actual exports from the U. S. S. R. to Italy in 1934. Russian exports to Italy are paid for in lire, the U. S. S. R. using the exchange to buy Italian goods. This is naturally an advantage considering the strict exchange control. The agreement remained in force until July 30, 1936.

The chief U. S. S. R. exports to Italy are wheat, petroleum products, wood, coal, furs, iron-ore etc. Italy's chief exports to Russia are industrial products such as electric motors, motor cars, chemicals, etc.

Trade relations, regulated by the trade treaty of 1924 and the subsequent supplementary agreements, have in general developed satisfactorily. In recent years there have been certain controversies but these were resolved by the economic agreement concluded on February 7, 1939. This agreement also greatly extended the basis of trade by means of clearing arrangements.

Before the War Russia's trade with *Germany* was greater than with any other State. Imports from Germany constituted 47.5 per cent. of total Russian imports, while exports to Germany amounted to 30 per cent. of all Russia's exports.

After the War, following the provisional agreement with Germany of May 6, 1921, a trade treaty was concluded on October 12, 1925 which regulated the whole complex of economic relations between the two countries. The general provisions of this treaty confirmed Article 4 of the Treaty of Rapallo of April 6, 1922 by which the most favoured nation clause was made applicable to the general relations between the two countries, with the exception, as before, of preferences granted by Russia to the Baltic states, Iran, Mongolia, etc.

On May 28, 1932 a customs agreement was signed which allowed reductions of duties, or even duty free entry of many Russian exports to Germany such as cotton, flax etc.

In 1926 a credit agreement which had been concluded between the U. S. S. R. and German firms for the delivery of goods to the U. S. S. R. amounting to 300 million marks, was guaranteed up to 60 per cent. by the German Government (the German Government accepting 35 per cent. of the guarantee and the Governments of the provinces (*Länder*) in which the firms were situated 25 per cent.). The loans were for from 3 to 4 years. This was the first case of a large credit being guaranteed by the Reich for exports to the U. S. S. R..

To facilitate the exchange of goods in so far as it was dependent on exchange control, a protocol was ratified on December 22, 1931 by which commercial operations should take place in reichsmarks. By renouncing her claim to be paid in foreign currency for goods exported to Germany the U. S. S. R. obtained the right to pay in reichsmarks for orders placed in Germany. This made the German balance of payments more favourable. In 1933 a second credit agreement for a sum of 300 million marks was concluded.

On April 9, 1935 the Soviet-German annual Economic Agreement was signed. It provided for the U. S. S. R. placing new orders in Germany worth 200 million marks in addition to the existing quantities purchased. For these orders a bankers' syndicate, under the direction of the *Deutsche Bank- und Discontogesellschaft* and the *Dresdner Bank*, granted the U. S. S. R. a credit of 200 million reichsmarks for an average term of 5 years. The German Government guaranteed this credit up to 70 per cent. Payments for Russian exports could as a rule only be used to pay for orders placed in Germany *i. e.* for the payment of German exports to the U. S. S. R.

The effect of the 1935 credit agreement was to make Germany the largest exporter to the U. S. S. R. in 1937. By 1938, however, Germany had fallen back to sixth place. Germany has also lost some of her importance as an importer of Russian goods, despite a rise from fifth place in 1937 to fourth place in 1938.

On December 19, 1938 the existing economic agreement on trade and payments was extended to cover 1939 without alteration. By this agreement the U. S. S. R. may export in 1939 an amount equal to the value of imports from Germany in 1934 and 1935, *viz.* 200 million reichsmarks. As before, payments are to be made in reichsmarks through special accounts with the leading German banks and also with the *Garantie- und Kreditbank für den Osten* in Berlin, a daughter company of the State Bank of the U. S. S. R.

Before the War the United Kingdom held second place in Russian foreign trade, coming second to Germany, although at a considerable distance. Since the War trade relations between the U. S. S. R. and the United Kingdom have undergone many vicissitudes, which may, however, be neglected here. On February 16, 1934 a provisional trade treaty was concluded to put trade between the two countries on a normal basis. This agreement also applies to India, Newfoundland, Southern Rhodesia, all the British colonies and to the British Protectorates in South Africa.

This provisional treaty is based on the most-favoured-nation clause, although with certain modifications introduced because of the trade policy of the U. S. S. R. (special treatment for Baltic and Far-East States) and of the British system of imperial preference. The treaty aims at a gradual readjustment of the Anglo-Soviet trade balance. U. S. S. R. payments for imports from the United Kingdom 1 to 1.7 in 1934, 1 to and receipts for exports to the United Kingdom had to be in the proportion of 1.6 in 1935, 1 to 1.4 in 1936, 1 to 1.2 in 1937 and 1 to 1.1 subsequently. These proportions were strictly observed by the U. S. S. R., and even exceeded, for at the end of 1937 £16.113.000 were paid in excess of the given proportion.

On July 28, 1936 an agreement was concluded which granted a credit of 10 million pounds sterling to the U. S. S. R. The credit was to be applied to

the payment in specie of Soviet orders for goods of British origin placed between August 1, 1936 and September 30, 1937.

The chief U. S. S. R. exports to the United Kingdom are wood, flax, cereals, furs, bristles etc. In 1937 U. S. S. R. exports to the United Kingdom amounted to 32.7 per cent. of her total exports, while Russian imports from the United Kingdom amounted in the same year to 14.3 per cent. of all imports, compared with 6.2 per cent. in 1929.

The present composition of Russian exports to *France* has changed considerably compared with the pre-war position. In 1913 cereals amounted to almost half (48 per cent.) of total Russian exports to France, flax and hemp coming second, and then wood and naphtha products. In 1933 exports of cereals to France barely amounted to 1 per cent. of the 1913 quantity. At the same time exports of the other products mentioned were higher.

These changes resulted in part from alterations in the economic structure of the U. S. S. R. and in part from a heavy decrease in wheat imports into France from all countries.

On January 11, 1934 a trade treaty between the U. S. S. R. and France was signed which secured the application of minimum tariffs to a number of Soviet products, such as cereals, butter and eggs. The advantageous treatment secured to cereals from the U. S. S. R. is largely formal, for, as has just been said, exports of these have greatly decreased. On the other hand sawn wood, which had been kept out by prohibitive tariffs, is now being increasingly imported, despite quota restrictions.

By the same treaty the U. S. S. R. agrees to place orders in France equal in value to the value of Soviet goods which are exported into France through special import quotas.

U. S. S. R. exports to France amount to an average of 5 per cent. of total Soviet exports. Imports from France in 1935 were 7.3 per cent. of total imports, but in 1937 they fell to 2.1 per cent.

Trade treaties with the *Baltic States* (Estonia, Latvia and Lithuania) are based not only on the most favoured nation clause but also on special treatment (*clause balte*). By this clause the contracting parties agree not to extend these special privileges to other States. This applies especially to the reductions on Baltic and Soviet tariffs laid down by the tariff convention.

In each of these States, the volume and terms of trade are based on a balance of trade, the value of exports from the U. S. S. R. to any one of these States having to equal the value of imports from that State to the U. S. S. R.

All the *Scandinavian Countries* and also *Belgium* have concluded trade treaties with the U. S. S. R. The first was *Sweden*, who on March 15, 1924 signed an agreement with the U. S. S. R. based on the reciprocal most favoured nation clause. On June 30, 1933 the total Swedish guarantee of credit for Soviet imports was fixed at Kr. 75 million.

Trade agreement based on the most-favoured-nation clause were also concluded with the *Central and South European States* (Poland, Czechoslovakia, Romania and Greece). The annual trade agreement with *Poland*, renewed each year since 1934, grants the U. S. S. R. tariff reductions on certain goods while

quotas have been fixed corresponding to the sums paid by the U. S. S. R. for imports from Poland. On February 19, 1939 a commercial agreement relating to reciprocal trade and clearing was concluded. This was the first occasion on which these two countries had signed a treaty based on the most favoured nation clause. By this agreement the U. S. S. R. will export tobacco, wool, cotton, fertilizers, furs etc. while Poland will supply the U. S. S. R. with coal, textiles, artificial silk etc. All operations will be conducted through the Polish Institute for the Adjustment of Payments.

Apart from the peace treaty of 1921, which, like that with Iran of the same year, deals with many economic questions, a trade agreement was signed with *Turkey* on March 11, 1927. It gives a precise definition to the trade relations between the two countries, which had hitherto been regulated by provisional arrangements. The treaty is based on the most favoured nation clause and aims at balancing Soviet exports to Turkey with Turkey's exports to the U. S. S. R.

On October 27, 1931 a new trade treaty was concluded with *Iran*, the first made by the Iranian Government since the publication in 1930 of the Law on the Iranian State Monopoly of Foreign Trade. The treaty, which was later renewed, was also based on the reciprocal barter principle. It established quotas for the import of the most important products. The U. S. S. R. exports to Iran cotton goods, agricultural machinery etc. and imports wool, skins, rice, dried fruits, etc.

On January 20, 1925 an economic agreement was signed with *Japan*, article 4 of which reads:— "Without prejudicing the right of each contracting party to regulate the international trade of his own country, it is agreed that neither of the two contracting parties shall apply, to the disadvantage of the other country, measures of prohibition, restriction, or taxation liable to impede the development of exchange, economic or otherwise, between the two countries. Both countries, in fact, intend to apply the most favoured nation clause to the trade, navigation, and industry of each country.

By a credit agreement of 1930 Japanese industry received contracts from Russia amounting to 41 million yen. To enable this credit to be financed the Japanese Government undertook to guarantee the loan.

Before the War Russia's balance of trade with Japan was favourable. Russia's chief exports to Japan were foodstuffs and semi-manufactured goods such as cereals, fish, oilcakes, linseed, fertilizers, raw and sawn wood, etc. Japan exported to Russia her surplus agricultural output such as rice, vegetables and fruits, and also certain industrial products. At present the U. S. S. R. balance of trade with Japan is unfavourable, since in payment to the U. S. S. R. for the Manchurian Railway Japan has agreed to employ 93.3 million yen of the purchase price in supplying goods to the U. S. S. R., starting from 1936. By the East China Railway Treaty, consignments of goods must have been exported by March 23, 1938.

Finally, on August 4, 1937 a trade agreement—one of the most important—was concluded with the *United States* by which the United States concede unconditional and unrestricted most favoured nation treatment to exports from the U. S. S. R. Thus Soviet exports enjoy every benefit (and not only as regards

the amount of the tariff, as was the case before July 13, 1935) at present applied by the United States to imports of goods from other countries. Thus by this treaty the U. S. S. R. enjoys the preferences accorded since 1934 to other nations by the Hull series of trade treaties.

The reduced tariffs apply particularly to linen goods, sawn timber, caviare, manganese ore, matches, etc., which are some of the principal Soviet exports.

In August 1938 this treaty was extended for 1939 and the Soviet Union agreed to buy goods from the United States up to a value of at least 40 million dollars, and at the same time to reduce exports of coal to the United States to 400,000 metric tons.

The signing of this treaty has been very favourable to the development of trade between the two countries. In 1929 U. S. S. R. exports to the United States amounted to 4.6 of total Soviet exports. By 1937 this figure had risen to 7.8 per cent. In the same years Russian imports from the United States were 20.1 per cent and 18.2 per cent., the United States taking first place as importer to Russia in 1937.

This covers almost all the countries whose trade relations, with the U. S. S. R. are regulated by treaties or economic agreements. In addition there are a number of other countries such as the Netherlands, Switzerland etc. where trade with the U. S. S. R. is of considerable importance but is not yet directly regulated.

### **Volume and character of the foreign trade of the U. S. S. R.**

The aggregate volume of foreign trade of the U. S. S. R. over twenty years, from the first years of the revolution to 1937 inclusive, in comparison with pre-war trade is shown in Table I on the following page.

As the table shows, foreign trade and especially exports ceased almost completely in the first period of revolution, the years of the economic blockade and of greatest inflation. In 1919 exports amounted to 0.4 million roubles and imports 14 million roubles. The NEP (New Economic Policy) introduced in 1921 and good harvests in 1922 and 1923 led to an increase in foreign trade, and by 1925 imports were greater than in 1913 by over a half. Exports however were only about a third of the pre-war figure.

In 1930 Russia's foreign trade reached the record figure of 9 milliard roubles, exports amounting to 4 ½ milliard roubles, a record for the post-war period. But from 1931 total foreign trade decreased from year to year until 1936 when it began to rise again, reaching in 1937 half the 1931 figure. The largest imports since the war were in 1931 at the height of the world economic crisis. Imports rose again in 1935-37 though still to only a third of the 1931 figure. The depression and trade policy in general led to a reduction of Russia's foreign trade and compelled her to reduce imports as much as possible. This tendency is one of the characteristic features of Russia's foreign trade relations with the world market.

TABLE I. — *Foreign Trade of the U. S. S. R., from 1918 to 1937, compared with the 1909-13 average.*

(Millions of gold roubles, at the exchange rate fixed in April 1936).

Year	Exports	Imports	Total Transactions	Balance of trade
Average 1909-1913 . . . . .	6,513.9	4,994.1	11,508.0	+ 1,519.8
1913 . . . . .	6,596.4	6,022.5	12,618.9	+ 573.9
1918 . . . . .	35.5	460.8	496.3	— 425.3
1919 . . . . .	0.4	14.0	14.4	— 13.6
1920 . . . . .	6.1	125.7	131.8	— 119.6
1921 . . . . .	88.5	922.9	1,011.4	— 834.4
1922 . . . . .	357.4	1,181.7	1,539.1	— 824.3
1923 . . . . .	954.8	627.2	1,582.0	+ 327.6
1924 . . . . .	1,476.1	1,138.8	2,614.9	+ 337.3
1925 . . . . .	2,664.4	3,620.9	6,285.3	— 956.5
1926 . . . . .	3,173.7	3,016.5	6,190.2	+ 157.2
1927 . . . . .	3,267.0	3,320.5	6,587.5	— 53.5
1928 . . . . .	3,518.9	4,174.6	7,693.5	— 655.7
1929 . . . . .	4,045.8	3,857.0	7,902.8	+ 188.8
1930 . . . . .	4,539.3	4,637.5	9,176.8	— 98.2
1931 . . . . .	3,553.1	4,839.9	8,393.0	— 1,286.8
1932 . . . . .	2,518.2	3,083.5	5,601.7	— 565.3
1933 . . . . .	2,167.5	1,525.1	3,692.6	+ 642.4
1934 . . . . .	1,832.4	1,018.0	2,850.4	+ 814.4
1935 . . . . .	1,609.3	1,057.2	2,666.5	+ 552.1
1936 . . . . .	1,359.1	1,352.5	2,711.6	+ 6.6
1937 . . . . .	1,728.6	1,341.3	3,069.9	+ 387.3

(1) Prices of goods for the years 1918-24 are calculated on the basis of the 1913 price level while from 1925 they are given in the prices of the corresponding year. For 1913 exports of platinum are included but for post-war years total exports do not include exports of platinum.

In this respect, a consideration of the volume of the foreign trade of the U. S. S. R. over the main periods of her economic development is very instructive. These periods are 1. the period of war communism and the NEP, 1918-28; 2. the period of the first Five Year Plan, 1929-32; and 3. the period of the second Five Year Plan, 1933-37.

TABLE II. — *Exports and Imports in the three main periods of economic development in the U. S. S. R.*

(Millions of roubles at the April 1936 rate of exchange for foreign trade settlements).

	Period of war communism and NEP 1918-28	First Five Year Plan 1929-32	Second Five Year Plan 1933-37
Exports . . . . .	12,023.9	18,175.3	8,696.9
Imports . . . . .	14,429.0	20,592.5	6,294.1
Total transactions . . . . .	26,452.9	38,767.8	14,991.0
Balance . . . . .	— 2,405.1	— 2,417.2	+ 2,402.0

This comparison shows that in the first Five Year Plan foreign trade reached its highest point with almost 39 milliard roubles, but the balance was still somewhat more unfavourable than in the period of war communism and NEP. The corresponding figures for the second Five Year Plan are not only lower than those for the period of war communism and NEP, but also lower than those for the first Five Year Plan. Indeed, exports during the second Five Year Plan are less than half exports in the first Five Year Plan, and imports less than a third in the same period. But the main difference is that in the period of war communism and NEP total trade showed an unfavourable balance of 2.4 milliard roubles and the first Five Year Plan almost the same, while in the second Five Year Plan total trade showed a favourable balance of 2.4 milliard roubles. In this latter period exports fell less than imports, leaving a favourable balance of trade in each of the five years of the second Plan.

This development in foreign trade reflects profound changes in the structure of the Soviet economic system. The U. S. S. R.'s economic policy aimed, as is well known, at industrializing the country as much as possible within a short time and at developing the technique and mechanization of agriculture; and for the most part this could only be accomplished by importing a great variety of machines and equipment from abroad. The main aim of foreign trade was the importation of necessary manufactured goods. Exports only served as a means of satisfying commercial requirements in accordance with this aim.

Sometimes, as in 1930 with the prices of cereals, export prices had to be kept lower than world prices; for it was not the immediate return that was important but the realization of the industrial plan for the country as a whole. This was the guiding principle during the first Five Year Plan. The result was an adverse balance for the value of the imports required generally exceeded that of exports. Exports had to be pushed by every means, not to obtain a favourable balance of trade, but, to repeat, to increase further imports of machine equipment and so by means of a temporary large dependence on foreign supplies to organize the country as quickly as possible on a permanent basis of economic independence.

In 1931 imports of machines into the U. S. S. R. amounted to a third, and in 1932 to almost a half, of total world exports of all machines (with the exception of motor cars). Probably no country had ever before imported in so short a period as five years as many machines as did the U. S. S. R. during the first Five Year Plan. Meanwhile the supply of machines to agriculture has steadily increased. In 1929 only about 500 tractors were in use in agriculture. By 1938 the figure had already risen to almost half a million (454,000). In 1936 there were 50,300 combine harvesters and in 1938 the figure had risen to 153,500, etc. As a result of the increased home output imports of these machines in the second five year period have fallen to almost nothing.

This fall in imports reduced Russia's foreign indebtedness from the maximum of 1,400 million roubles in 1931 to 375 million roubles in 1937. Since then it has sunk still further and at present total indebtedness abroad is barely twice the 200 million roubles paid in 1913 in interest and amortization on Russian foreign debts alone.

In 1935, for the first time in her 18 years' existence, the U. S. S. R. had a favourable balance both of trade and of payments. Before the War a favourable balance of trade was accompanied by an unfavourable balance of payments owing to the large sums which Russia had to pay abroad for the service of her foreign debts. Before the War Russia's balance of payments was largely dependent on the condition of the harvest, and exports and prices of cereals. To-day, as we shall see shortly, Soviet exports are much less dependent on exports of cereals, while their composition has become much more varied.

In this context it may also be mentioned that the output of gold in the U. S. S. R. has risen from 53,000 kg in 1930 to from 240,000 to 245,000 kg in 1937 and at present represents about a sixth of the world output. The U. S. S. R. therefore is the second largest producing country, coming next to South Africa, though at a considerable distance. With the present difficulties in the international exchange of goods and money this steady increase in the supplies of gold in the U. S. S. R. has considerable significance for the country, especially as regards her currency and the development of her foreign trade.

A further tendency of Russia's foreign trade is the fall in the percentage share of exports in the total production of the country. This is a result of the increasing consumption of the goods within the country. In 1913 exports (in terms of value) amounted to 11.6 per cent. of the total output; in 1930, the year of the greatest volume of exports from Russia, this proportion was only 3.5 and had fallen in 1938 to 1 per cent. At present only 1 per cent of the total output of cereals is exported, compared with 12.7 per cent. for wheat in 1913, 34 per cent. for barley and 28.3 per cent. for maize. At present Russian production is turning more and more to the rapidly developing home market.

The following table shows the quantities of cereals and legumes exported before the War, in the NEP period, and during the first and second Five Year Plans.

TABLE III. — *Exports of Cereals and Legumes in the four different economic periods:*

(Thousands of metric tons).

Crops	Average 1909-13	Average 1923-24/1927-28	Average 1929-32	Average 1933-37
	Economic year		Calendar year	
Wheat . . . . .	4,239	554	1,395	516
Rye . . . . .	655	416	544	122
Barley . . . . .	3,718	326	682	333
Oats . . . . .	1,088	54	191	88
Maize . . . . .	763	145	118	52
Total for cereals . . .	10,463	1,495	2,930	1,111
Legumes . . . . .	370	55	92	67

Compared with the pre-war period, exports of all cereals and of legumes have fallen off greatly since the war. This was especially so in the NEP period when agriculture, which had been ruined by the years of war, revolution and hunger was only concerned with reconstructing its productive capacity.

Thus during the First Five Year plan exports rose relatively, exports of wheat reaching about a third of the pre-war figure, and of the five main cereals taken together (wheat, rye, barley, oats and maize) somewhat over a third. During the second Five Year Plan exports fell even lower than in the NEP period. The reasons for this will be shown in the discussion on exports of wheat.

The following table shows the value of exports of the chief agricultural products for each year from 1920 to 1937, compared with the average for the years 1909-13.

TABLE IV. — *Exports of the Main Agricultural Products.*

(Millions of roubles at the April 1936 rate of exchange).

Year	Cereals	Flax, flax-twine and linen cloth	Cotton and cotton goods	Butter	Sugar and sugar products	Wood and wood products	Skins and furs.
Average 1909-13 .	2,619.7	343.8	147.1	272.8	179.3	635.5	31.7
1920. . . . .	0.9	1.9	—	—	0.0	2.2	0.0
1929. . . . .	43.9	222.6	195.1	135.8	150.5	668.0	467.0
1930. . . . .	882.4	155.0	205.5	46.0	118.3	743.5	336.6
1931. . . . .	658.9	85.8	203.1	106.4	143.2	497.5	246.2
1932. . . . .	228.1	100.4	226.7	69.5	56.1	352.7	185.3
1933. . . . .	176.9	97.1	136.8	53.5	24.3	336.1	168.9
1934. . . . .	83.6	95.3	108.0	44.5	20.0	391.1	141.3
1935. . . . .	161.9	91.7	75.2	43.0	23.9	365.6	132.0
1936. . . . .	35.9	81.4	67.4	42.1	36.8	359.5	155.1
1937. . . . .	257.6	54.8	130.7	31.8	38.5	437.8	153.6

This shows that exports of wheat, even the maximum quantity of 1930, were only a third of the 1909-13 figure. They then fell still further but later rose to a value of 257.6 million roubles in 1937, amounting to a little less than a third of the 1930 figure. Exports of butter and sugar reached their highest point in 1929 but they were still less than in 1909-13. The returns from exports of a large number of other goods, however, such as wood, furs and skins, and cotton in post-war years have been higher and sometimes considerably higher than before the War. For example in 1930 exports of wood reached 743.5 million roubles compared with 635.5 million roubles before the War. The value of skins and furs were 467 million roubles in 1929 against 31.7 million roubles before the War. In 1932 exports of cotton and cotton goods reached the record value of 226.7 million roubles against 147.1 million roubles before the War.

The Table V shows the percentage share (in terms of value) of the chief agricultural goods in total exports from Russia.

TABLE V. — *Percentage Share of the Chief Agricultural Products in the value of total Exports from the U. S. S. R.*

Product	1913	1932	1936	1937
Wheat . . . . .	14.8	3.4	0.7	10.8
Rye . . . . .	2.2	2.3	0.8	2.1
Barley . . . . .	12.3	2.1	0.6	2.0
Flax . . . . .	5.7	2.5	5.7	2.8
Cotton and cotton goods . . . . .	2.9	9.8	4.7	7.4
Butter . . . . .	4.7	2.8	3.1	1.8
Sugar . . . . .	1.3	2.3	2.4	2.0
Wood and wood products . . . . .	12.3	15.0	26.5	25.4
Skins and furs . . . . .	—	7.5	7.6	6.2

The percentage shares of cotton, wood, furs and skins have therefore risen somewhat in comparison to 1913 whereas those of wheat, barley, butter and in part also flax have fallen considerably.

These changes are all closely linked up with the altered structure of Russian foreign trade.

#### Alteration in the composition of Russian foreign trade.

The economic plan of the U. S. S. R., which, as said before, effected among other things a thorough technical reorganization of agriculture, also altered the composition of Russia's foreign trade. In the last few years profound changes have taken place both in the import and export trade. The following table shows the percentage share of agricultural and non-agricultural exports in the total world trade of the U. S. S. R. compared with the figures for 1913.

TABLE VI. — *Percentage Share of Agricultural and Non-agricultural Products in the Total Trade of the U. S. S. R.*

Year	Agricultural goods	Other goods	Year	Agricultural goods	Other goods
1909-13 . . . . .	70.6	29.4	1931 . . . . .	42.1	57.9
1923-24 . . . . .	69.7	30.3	1932 . . . . .	31.9	68.1
1924-25 . . . . .	58.9	41.1	1933 . . . . .	28.8	71.2
1925-26 . . . . .	57.6	42.4	1934 . . . . .	28.4	71.6
1926-27 . . . . .	55.3	44.7	1935 . . . . .	26.7	73.3
1929 <sup>(1)</sup> . . . . .	38.9	61.1	1936 . . . . .	20.3	79.7
1930 . . . . .	41.8	58.2	1937 . . . . .	31.7	68.3

<sup>(1)</sup> Until 1929 the financial year in the U. S. S. R. ran from October 1 to September 30 of the following year. Since 1929 it has coincided with the calendar year.

This table shows that before the War slightly over two-thirds of Russian exports consisted in agricultural goods, and slightly over one third in other goods of which a very important part were exports of unmanufactured wood. Half the agricultural exports consisted of bread cereals with a value of 625 million roubles, out of a total value of world exports of 1,501 million roubles in 1913<sup>(1)</sup>. This predominance of agricultural exports was also the outstanding feature of the NEP period. For example in 1923-24 the share of agricultural goods in total U. S. S. R. exports (69.7 per cent.) was still almost as large as in 1913.

In 1924, for the first time in the history of the Soviet Union, wheat was exported, amounting to 40 per cent. of the exports of that time. Other agricultural products such as butter, eggs, etc. were also exported in considerable quantities. But at the same time, non-agricultural products such as wood, coal, manganese ore etc. were also being exported with the result that in 1924-25 59 per cent. of all exports were agricultural and 41 per cent. were non-agricultural. This tendency of agricultural exports to fall off, with a simultaneous increase in other exports, has been continuous and though slow at first, was rapid in the first, and even more so in the second, Five Year Plan.

In 1932 at the end of the first Five Year Plan, agricultural exports had already fallen to approximately a third of total exports, while industrial exports had risen to about two-thirds. Thus the relation between these two main categories of exports was then the exact reverse of that before the War. During the second Five Year Plan this trend became more and more marked, and by 1936 agricultural exports were no more than a fifth of total exports. In 1937, owing to a considerable increase in exports of cereals and cotton, the share of agricultural exports rose to a third, but in the same year the absolute figure for exports of industrial products showed an increase over 1936 of 97.3 million roubles.

Certainly, these figures are not to be analysed with mathematical precision; but they do show clearly the tendency of Russia's foreign trade to concentrate more and more on the export of non-agricultural goods. This means a complete change in the relation of the U. R. S. S. to the world market.

During the first and second Five Year Plans the value composition of both imports and exports, treated according to the various classes of goods (in accordance with the Brussels international classification) both show considerable changes, as shown in Table VII.

The table shows the large and characteristic changes which took place during the second Five Year Plan. Exports of the first class, livestock, which amounted to 2.3 per cent. in 1913, had fallen right off in 1937, and in fact, since 1931. At the same time, imports of this class increased substantially moving from 0.3 per cent. in 1913 to 3.4 per cent. in 1937. This shift is due to the position of stockraising in the U. S. S. R. During the first Five Year

(1) At the pre-war rate of exchange for roubles.

TABLE VII. — *Changes in the Value Composition of Exports and Imports taken by Classes of Commodities at the end of the Second Five Year Plan and before the War.*

(Percentages).

	Exports		Imports	
	1913	1937	1913	1937
1. — Livestock . . . . .	2.3	—	0.3	3.4
2. — Foodstuffs and drinks . . . . .	56.8	22.9	13.4	6.4
3. — Raw and semi-manufactured goods . . . . .	38.7	58.6	51.0	49.9
4. — Manufactured goods . . . . .	2.2	18.5	35.3	40.3
	100	100	100	100

Plan stockraising in particular underwent a crisis the causes of which were many and complex and which lasted into 1935. From then on there has been a considerable increase in the number of cattle owing to a series of measures taken by the Government.

The share of the second class — foodstuffs and drinks — has also been greatly reduced. In 1913 exports of these amounted to more than a half (57 per cent.) of all Russian exports whereas in 1937 they were only 23 per cent. This was not only a result of the development in recent years of the capacity of the home market, but also of the heavy fall in the prices of these commodities on the world market. Imports of these products also fell considerably: from 13.4 per cent. in 1913 to 6.4 per cent. in 1937.

The share of raw materials and semi-manufactured goods in total exports increased during this period by one and a half times, rising from 38.7 per cent. to 58.6 per cent. At the same time imports of goods in this class have fallen off somewhat, moving from 51.0 to 49.9 per cent. Raw and worked wood, petroleum, flax, cotton goods etc. all come into this class. At present they take first place in exports from the U. S. S. R., while in 1913 they were second at 39 per cent. of total exports. They were therefore considerably less important than exports of foodstuffs and drinks which in 1913 took first place with 57 per cent.

Undoubtedly, however, the most complete transformation has occurred in the foreign trade in manufactured goods. Exports of these rose from 2.2 per cent. in 1913 to 18.5 in 1937, mainly owing to the industrialization of the country. But at the same time, imports of manufactured goods, owing to the increased imports of machinery, consisting mainly of newly invented machines, rose from 35 per cent. in 1913 to 40.3 per cent. in 1937.

This change is characteristic and indicates a reorientation of Russia's foreign trade, the underlying cause of which is closely bound up with the economic

development of the U. S. S. R. and the slow transformation of what was an agricultural country into an increasingly industrial one. It is characteristic that the total value of agricultural production (calculations being based on 1926-27 prices) increased from 12.6 in 1913 to 15.8 milliard roubles. Over the same period the value of industrial production rose from 10.3 to 59.3 milliard roubles, nearly six (5.8) times greater.

The following table shows alterations in the structure of the Russian economic system over the period 1913-36.

TABLE VIII. — *Alterations in the Composition of Production and Exports of the U. S. S. R. during the last 24 years.*

Year	Percentage share of industry in the total output of the U. S. S. R.	Percentage share of industry in exports from the U. S. S. R.	Percentage share of agriculture in the total output of the U. S. S. R.	Percentage share of agriculture in exports from the U. S. S. R.
1913 . . . . .	42.1	30.0	57.9	70.0
1929 . . . . .	54.5	61.1	45.5	38.9
1930 . . . . .	61.6	58.2	38.4	41.8
1931 . . . . .	66.7	57.9	33.3	42.1
1932 . . . . .	70.7	68.1	29.3	31.9
1933 . . . . .	70.4	71.2	29.6	28.8
1936 . . . . .	79.2	80.1	20.8	19.9

This table shows the continuously increasing importance of industry in the production of the country during the last quarter of a century. The export trade shows a parallel movement, its composition approximating more and more to that of national production.

In 1913 industry's share in the total national production was 42.1 per cent. while it supplied only 30 per cent. of exports. By 1936 these percentages had risen to 79.2 and 80.1 respectively. The corresponding figures for production and exports of agricultural goods were 57.9 and 70 per cent. in 1913 compared with 20.8 and 19.9 per cent. in 1936.

Thus the general economic plan has ensured that exports were more and more closely adapted to changes in the internal structure of the economic system.

Certain conclusions regarding the economic possibilities of agricultural exports from Russia before the War and at the present time could be drawn from this fact; but to do so would be outside the scope of this short study.

(To be continued).

M. TCHERKINSKY.

## **INTERNATIONAL CHRONICLE OF AGRICULTURE**

### **CUBA**

Cuba's economic position depends mainly upon the prosperity of the sugar industry. In 1902 the United States granted a preference to Cuba of 20 per cent. which came into force in 1903, and from this date there was a strong tendency towards monoculture at the expense of other branches of production which had previously flourished (coffee) and which, though they did not entirely disappear, remained stationary alongside the dominant crop (fruit and vegetable growing, animal husbandry).

While sugar growing prospered, the whole economy of the country was based on the profits which could be made from this one crop, not merely manufactured goods but even supplies for immediate consumption being bought from abroad.

In terms of value, exports of sugar have always formed a very high percentage of total exports. In the five years 1909-13 they averaged about 70 per cent. rising to 89 per cent. in the five years 1919-23. During the next ten years they fell, being 75 per cent. for the five years 1929-33, but rose again to 82 per cent. in 1936.

This tendency was disastrous for the country even when times were prosperous. Cuba's economic life has become extremely sensitive to fluctuations in the trade cycle while the home market is so disorganised that very often producers do not trouble about the quality of goods supplied to this market and even the rural population thinks nothing of buying tinned and imported foodstuffs in place of home-grown products.

The producers and consumers needed educating, the more so as the country had to alter its policy completely when it appeared that the old prosperity based on sugar could not return.

The output of certain crops had to be expanded and new ones introduced; first to supply the country's own needs and secondly, if possible, to export. It was sought, often with success, to reduce and even eliminate imports of certain goods by increasing the output of some goods (rice), producing new ones (butter) or by setting up new industries. Although these alternatives are still far less important than sugar in Cuba, they have, with mining operations and receipts from tourists, to some extent helped to maintain the country's economic equilibrium in the difficult position in which the crisis in the sugar trade placed it.

The table on the following page shows the comparative importance of the principal items of Cuban export trade.

The predominance of the United States in this trade is shown by the following figures giving the percentage of the total value of Cuban exports going to the United States:

1932	1933	1934	1935	1936
71.25	67.67	75.26	79.31	78.72

### Sugar <sup>(1)</sup>.

For the last few years before the War sales and prices of sugar depended on three markets—the local market, the United States market and the world market. The population of Cuba is small and the home market of limited importance. But the very existence of sugar growing in Cuba depends upon the possibilities of selling in the United States market and upon these depend also the quantities which must be placed on the world market and perhaps the need for restricting output. Until a short time before the War the United States market absorbed almost the whole of Cuba's output of sugar, which enjoyed the preferential tariff of 20 per cent. conceded by the Reciprocity Treaty of 1902 mentioned above.

However, Cuba must always meet competition on this market from United States producers of beet sugar, the sugar cane growers of Louisiana and Florida and from the sugar cane planters of Puerto Rico, the Philippines and Hawaii. The amount of preference granted must always depend on a compromise between protecting the interests of these producers and the desire on the part of the United States to maintain

(1) There are several recent works covering the development of the sugar crisis in general and in Cuba in particular. Here we shall confine ourselves to sketching in those facts necessary for an understanding of the position of sugar production in Cuba during the years 1937 and 1938.

economic and social, and consequently political, equilibrium in Cuba, and the latter's power of purchasing American commodities.

Cuba's exports to Europe before the Great War were small, but as the War proceeded they suddenly leapt to enormous proportions and the demand from the belligerent nations led to a rapid increase in output (4,097,771 metric tons <sup>(1)</sup> in 1919). Prices reached such a level that the importing countries requested the United States to supervise prices and so keep them at a reasonable level. When, in 1919 this supervision was abolished, prices rose steeply and production expanded beyond all rational limits. But the great demand which had caused this rise did not outlast the War by very long, and Cuba found herself with very large stocks and faced with prices which had fallen from over 20 cents per lb. in 1920 to less than 2 cents in 1922. Beet growing did not recover rapidly in Europe, however, and as consumption increased there was a recovery from 1923 to 1925 which led Cuba to expand her output again, until it reached 5,272,268 metric tons in 1925.

Over the same period both Europe and the United States were reinforcing existing measures of protection and introducing new ones. (United Kingdom: tariffs, subsidies, preferences). Europe was increasing her output of beet and gradually approaching her pre-war level of production. At the same time, the cane planters of Puerto Rico, Hawaii and the Philippines and the beet growers of the United States were also increasing their output. Thus Cuba's market shrank simultaneously both in Europe and in the United States. At first she tried to remedy this by restricting her own output and then, in 1930, owing to the economic crisis and the increasing protectionism in the United States and elsewhere, she decided, with the principal countries selling sugar on the international market, on the Chadbourne Plan, which came into force for the 1931 crop. Despite the sacrifices conceded by the signatories, however, the prices of sugar continued to fall in 1931-32.

In these circumstances the United States gave her assistance. By the American sugar law of 1934 Cuba obtained a fixed quota which guaranteed her being able to place on the American market about 272,155 metric tons more than she had been able to do under the old tariff. Further, in 1934 a presidential decision reduced the customs tariff on Cuban sugar (96° polarization) from 2 to 1.50 cents. per lb. (Later, by the reciprocity trade agreement of August 1934 it was reduced to 0.90 cents as against the ordinary tariff of 1.875 cents.).

The Chadbourne agreement terminated on September 1, 1935. Its success had been small but the need for international collaboration remained and the International Sugar Conference, convened by the World Monetary and Economic Conference, concluded a new agreement on May 6, 1937 <sup>(2)</sup>. Cuba was granted a quota of 940,000 metric tons for the free international markets. This quota equalled her exports for 1936. It was higher than that granted by the Chadbourne Plan and was renewed by the October 1937 session of the International Sugar Council.

With fixed quotas for the American and free international markets, and knowing the volume of local consumption, Cuba is in a position to adjust her output to the

(1) Owing to the diverse standards of weight used in the original sources, the figures in this section have all been converted into metric tons.

(2) For a full account of the London Conference see ROBERTSON, C. J., *The International Sugar Agreement. Monthly Bulletin of Agricultural Economics and Sociology*, International Institute of Agriculture, October 1937, pp. 358-368.

maximum quantity marketable and to avoid overproduction. Each year the Cuban Institute for the Stabilisation of the Sugar Market, which was founded on May 6, 1931 and represents all producers, fixes the quantity to be produced, arranges how this shall be distributed between the different producers and distributes it for export according to the different agreements and quotas fixed. The Institute's proposals must be approved by the Government before being carried into effect. The output authorized for 1937-38 was 2,714,531 metric tons, and the actual output 3,023,436 metric tons. A presidential decree of January 1, 1939 fixed the output for 1939 at 2,481,281 metric tons.

In April 1938, when the grinding of the sugar cane had been completed, prices on the American market fell lower than they had been for years and those on the world market fell below what they had been before the international agreement had been signed. The resulting average price was disastrous for Cuba and the larger part of the 1938 crop was still unsold in April.

The opinion in Cuba was that the quotas fixed by the international agreement should again be reduced. They were reduced by 5 per cent. at the April 1938 session of the International Sugar Council and by a further 5 per cent. at the July session of the same year, the second reduction applying from September 1, 1938. The quota for the free market thus fixed for Cuba for the year September 1, 1938-August 31, 1939 is 831,763 metric tons. The Cuban quota for the United States was fixed on June 4, 1938 at 1,780,596 metric tons.

A new market has been opened up to the Cuban refiners in the United States, where they are allowed to sell refined sugar for the production of fruit jams for export as part of the world quota and not as part of the Cuban quota to the United States. The importers must re-export within twelve months.

Besides raw and refined sugar, Cuba exports molasses, a by-product of the manufacture of sugar. But the export of molasses, which had seemed to be a solution to the problems raised by the sugar crisis, has itself become a difficult problem. The price of molasses is so low that production is no longer remunerative, but Cuba is loth to give it up as molasses production offers a supplementary occupation to the workers. A Government decree has even prohibited its manufacture at the same time as that of sugar in order to prolong the season which is, in any case, very short. Further, it is feared that by reducing manufacture and exports, production in other countries would be encouraged, and that by raising the price greatly the market would be captured by competitors supplying cheaply other raw materials for the production of synthetic alcohol. It is suggested that instead of being exported, molasses should be used for the manufacture of alcohol in Cuba itself.

The American Sugar Law of 1934 should have expired on December 31, 1937. The position which would have arisen if this law had not been prolonged had been causing much anxiety in Cuba and the news that the President of the United States had signed on September 1, 1937 a further law maintaining the quota systems was received with much satisfaction. The Cuban quota was fixed at 1,734,062 metric tons, 29 per cent. of the United States requirements. Further, the prices of sugar on the United States market, which are regulated by the Secretary of Agriculture, were to be fixed in relation to three other staple commodities. Finally, Cuba will share in all alterations of the quota, with the exception that if the output of the Philippines is insufficient to cover the quota allotted to that country, the deficit will be divided between the other suppliers to the exclusion of Cuba. As a result of this regulation the Cuban quota was raised to 92,033 metric tons in September, 1937. This represents Cuba's share in the additional quotas allotted to make up the deficit in the quota for American beet.

The most important event affecting Cuba's sugar industry in 1937 was the passing on August 25 of the *Law on the Coordination of Sugar Production*. This law which carries into effect an important part of the "Three Year Plan" <sup>(1)</sup>, was drawn up by a mixed committee of representatives of the sugar industry and members of Congress. One of its main aims is to protect the small grower. *Inter alia*, each grower is entitled to grind a quantity of sugar equal to his entire 1937 estimate, up to a maximum of 30,000 *arrobas* (1 *arroba* = 11.5 kg.). A deduction of 6 per cent. is made from the quotas of growers whose 1937 estimates exceeded 500,000 *arrobas*, and one of 12 per cent. from the quotas for sugar cane grown on land belonging to factories. If these deductions are insufficient, the deficiency is made up from a special small growers' protective fund.

In return for these special advantages small growers must devote part of their land to food crops.

The existing moratorium laws are extended to cover debts incurred by growers before June, 1933 as long as the debts remain unadjusted. Pending such adjustment by mutual consent, growers are not required to pay more than 20 per cent. of the net output of their plantations, and not more than 60 per cent. after adjustment.

Leases are extended as long as crop restriction lasts, provided rentals are paid regularly, cane is supplied and production maintained at a minimum of 30,000 *arrobas* per *caballeria* planted (1 *caballeria* = 13.42 hectares). Current rentals remain in force if they are not higher than those provided in the Act. If there has been no contract, rentals will not be lower than 70 dollars per *caballeria* while sugar is sold at the price obtaining when the law was passed. Rentals for irrigated lands, are increased by 50 per cent. Wages of those working on the crop were increased the increases being graded according to the average yields obtained by each mill in the three preceding years. Minimum wages are fixed for the crop season and also for the dead season.

Retail prices at stores in the factories must not be higher than those normally charged in the nearest town plus transport costs. Mill owners and operators of plantations must provide free sites for the erection of employees' and workers' cooperatives.

Mills and plantations with unused lands must place a reasonable proportion of these, free of charge, at the disposal of the workers, to enable them to grow food crops during the dead season.

## Tobacco.

Cuba's most important product after sugar is tobacco. *Vuelta Abajo*, used for making cigar wrappers, and Havana cigars in general take first place. About half the output is consumed in the country, but 25 million cigars are exported per annum. The United Kingdom buys about a third of these, but the greater part goes to the United States. Nevertheless, the complaint is made in Cuba that the markets are neither as dispersed or as large as the excellent quality of the tobacco warrants. This is attributed partly to tariffs, which prevent this product from being imported into many countries, but also to a change in consumers' tastes, since for some time cigarettes have been preferred to cigars and oriental tobacco to the dark tobacco of Cuba. The consular agents abroad who have studied the question on the spot recommend that trade agreements should be reached with countries not producing tobacco, and that

---

<sup>(1)</sup> See p. 169.

a Cuban cigarette of oriental type more adapted to the changed taste of consumers should be manufactured. A tobacco experimental station has been set up to study questions relating to tobacco. It is also hoped to set up a national cigar factory.

### Fruit and vegetables.

Cuba has been engaged in the production and export of fruits and vegetables for quite a long time, though until recently the trade has been of little importance. In the last few years, however, it has greatly increased, especially on the Isle of Pines. Exports of these products go mainly to the United States. The crops are earlier in Cuba than in the latter country and can therefore be easily marketed. In 1937 an agreement was reached between the fruit and vegetable producers of Florida and the Association of Horticulturists and Fruit and Vegetable Exporters of Cuba on the rules and seasons for imports into the United States. This agreement enables Cubans to market their products without harming American producers. The vegetables chiefly exported are tomatoes, egg-plants, potatoes, green peppers, Lima beans, cucumbers, ochras, squash and string beans. Large quantities of grape-fruit, avocado pears, pine-apples and bananas are also exported. The majority of these fruits go to the United States, though the Cuban grape-fruit is one of the most popular on the London market.

In May 1938 new possibilities were opened up to Cuban fruit growers by the *Compañía Sud-Americana de Vapores* offering to arrange for its vessels to touch Havana on their way from Chile to European ports from this date. The boats are fast and equipped for this type of freight. They are supplied with refrigeration equipment. Thus pine-apples, avocado pears, oranges and grape-fruit may find new outlets.

To improve the quality of fruit and vegetable exports and to help them to meet competition from other countries more successfully, a presidential Decree of December 16, 1936 imposed rules for the grading and packing of fruits and vegetables for export.

### Coffee.

Coffee was introduced into Cuba at the end of the 18th century and was of great importance until the expansion of sugar cane growing and the absence of tariff protection led to the destruction of many plantations. After the sugar crisis, however, there was a movement to return to coffee growing. Sheltered by protective duties, output was soon adequate to satisfy the home demand at remunerative prices, but it was not long before overproduction occurred and surpluses of coffee, whose quality and cost of production made competition difficult with that from other sources, had to be placed on foreign markets. In 1934 the Government founded the Cuban Institute for the Stabilisation of the Coffee Market to study all questions relating to the cultivation, preparation and sale of coffee. In July, 1935 exporters were required to obtain export permits and holders of raw coffee to withhold 25 per cent. of their stocks from the market. Such stocks could only be marketed by the Institute. Some time later the 25 per cent. was raised to 50 per cent. The Department of Agriculture was then authorized to fix in April of each year the percentage of coffee to be held off the market, calculations being based on the official estimates of home production and consumption. Minimum prices were also fixed for the producers of non-decorticated coffee and maximum and minimum prices for middlemen. A series of taxes on coffee were introduced to cover the costs of organizing the coffee market.

In August 1937 the representatives of fifteen countries met at Havana for the second Panamerican Coffee Conference. The conference decided to eliminate poor quality coffees in order to stimulate consumption and raise the price without having recourse to crop restriction<sup>(1)</sup>. One of the Conference's decisions to which Cuba adhered is the payment to the Panamerican Coffee Office for a propaganda fund, of 5 cents on each 60 kg. sack exported. The lowest quality which might be exported was also decided. In addition to the Panamerican Conference, two national coffee conferences were held at Cuba in 1937 and 1938, to consider measures for improving coffee growing and making it more remunerative. The second conference recommended the inclusion of coffee in all treaties of commerce, particularly in those concluded with countries having a controlled economy. Before the second conference, a decree of January 10, 1938 had introduced an export premium to compensate for the low prices of coffee. The Department of Agriculture and the Institute for the Stabilization of the Coffee Market pay the premium (0.25 dollars per quintal of 100 pounds of 460 grams exported) out of a special fund.

The various measures taken have improved the general position of the market, though that of producers still leaves much to be desired.

### Stock-raising.

In 1937 Cuba had from 2,600,000 to 2,900,000 head of *cattle*. Stockraising is already sufficient for national requirements, and must now even find outlets for a surplus of 50,000 head of cattle annually. A presidential Decree of December 16, 1937 set up a commission for the protection of home stockraising. To encourage the rearing of *pigs*, for which the natural conditions of the country are suitable, a decree of January 2, 1937 allowed pigs of the main breeds to be imported duty free, for the purpose of improving Cuban stock.

The output of *cheese* has increased considerably during the last few years. Up to 90 per cent. of the demand for *condensed milk* is covered by home production. The output of *butter* has so much increased since 1928, when 1,424,164 lbs. of butter costing 585,871 dollars had still to be imported, that in 1936 651,512 lbs., worth 132,612 dollars, were exported. The home output is estimated at 3,500,000 - 4,500,000 lbs.

Other animal products forming important and relatively stable exports are *skins and hides*. These exports could probably be substantially increased by improving methods of stockraising and of preparing the skins and hides, and above all by careful classification before placing them on the market.

### Henequen.

Henequen, a strong fibre which is popular for manufacturing twine and cord, is obtained from the *Agave fourcroydes*. It is grown chiefly in Mexico, but the climatic, soil and rainfall conditions in Cuba are well suited to its cultivation, while low costs

---

(1) For further details see ARCOLEO, F., The International Organization of the Coffee Market. *Monthly Bulletin of Agricultural Economics and Sociology*. International Institute of Agriculture, September 1938, pp. 419-422.

of transport to the United States encourage the expansion of this crop. In 1937 there were six large plantations supplied with the equipment needed to prepare the fibre. About 8,000 acres are planted and there are still great possibilities of extending the acreage under this crop. The annual output of fibre is about 8 million lbs. Both the raw fibre and twine and cord are exported.

### Rice.

Cuba's climate is suitable for rice growing, and since 1929 much has been done to increase the output of this crop. Rice may either be grown on irrigated land or as a dry crop, if suitable varieties are chosen. In 1938 500,000 quintals of rice were produced, but 3,500,000 quintals, valued at 12 million pesos, were still being imported. To produce this amount an average of 15,000 *caballerias* would have to be cultivated. This would give work to 175,000 persons, thus reducing unemployment and would also enable large areas, hitherto under sugar cane, to be used for other purposes and to be cultivated during the idle season.

### Silk.

Silk production is one of the domestic industries which it is sought to introduce to supplement the returns of the small farmer and to give him employment during the dead season, which is long in Cuba. The mulberry remains green throughout the year in Cuba, so that by a careful choice of methods of rearing silkworms production can be carried on the whole year round. Tests are already being carried out to find the varieties of mulberry best suited to Cuba's climate, on methods of growing them, and on the most suitable varieties of silkworms and the diseases to which they may be subject. A spinning and weaving establishment has been set up to instruct a number of workers who will later teach others the technique of silk manufacture.

The Department of Agriculture has planted 200,000 mulberry trees which, like the silkworm eggs, have been distributed between the farmers in the area. The mulberry, which also supplies an excellent livestock feed, may, as in the case of rice, be grown on surplus lands at present planted with sugar cane.

### Wood.

Although the expansion of sugar cane production has led to much deforestation, forests still cover a sixth of Cuba's territory. Cuba is rich in valuable woods such as cedar, mahogany, and ebony, which are exported. The Three Year Plan, referred to below, comprises reforestation with valuable varieties of trees.

### Other products.

Eggs, cacao, honey, maize and especially oilseeds and oil bearing fruits (sunflower, groundnut, sesame, soya and coconut) are becoming more important, especially since the imposition of protective duties on imports of soya oil.

### The Three Year Plan.

New crops had been encouraged at different dates well before the publication in 1937 of the Three Year, or Economic and Social Reconstruction Plan. But these earlier efforts did not form part of an organic whole. They were introduced piecemeal mainly for economic and commercial ends. The authors of the Three Year Plan had given much thought to the matter since the coming of the new régime, and they realised that Cuba's real problem is a social one. Only by solving the problem of the land system and general and vocational education can the economic position be improved. The Three Year Plan goes to the very root of the evil, the difficult position of the small farmer, or *colono*, who is generally a tenant, most frequently of the *métayer* type, more rarely owner, but almost always weighed down with debt. Further, the *colono's* tenure of the land is not guaranteed long enough to tempt him to introduce improvements. He cannot obtain credit on advantageous conditions and is often too ignorant to be able to augment his meagre resources through other occupations, even if these are not forbidden by the landowner.

The Three Year Plan, however, is more a general programme than a detailed plan. The different schemes will be carried out progressively by special laws, as has already been done in coordinating sugar production and in the reallocation and settlement of land. The words "three year" do not imply that the schemes will be completed, or even begun, within three years. The intention is rather to study all the problems included in the programme as a whole during these three years and to start carrying some of them out as opportunity arises.

As regards agriculture, the Three Year Plan comprises the following points:—

1. Coordination of sugar production. (See the law on the coordination of sugar production, p. 165.)
2. Land settlement. (See below for the law on State property and the reallocation of land).
3. Restriction of property rights.
4. Regulation of leases of rural properties.
5. Study of mine legislation and production.
6. Study of reforestation and utilisation of forests.
7. Utilisation of water, irrigation and drainage.
8. Development of farm instruction.
9. Regulation and improvement of stock-raising.
10. Development of bee-keeping and the cultivation of tobacco, coffee and cacao.
11. Expansion of fruit-growing.

The fundamental law for the execution of the Three Year Plan is the *Law on State Property and the Reallocation of Land*, which was signed by the President on December 17, 1937 and came into force with retroactive effect in January, 1938. Lands belonging to, leased by, or granted in concession by, the State, and lands bought by the Government or granted to it for this purpose, will be distributed and settled. To obtain such land, the would-be colonist must be Cuban and the head of a family. Naturalized citizens must have been domiciled in the country for at least ten years. Each head of a family

will receive a maximum of 30 acres of cultivable land. The land may not be distrained upon or transferred. The farmers must live on the new farm for six years, exploit it, lay out an orchard, and follow the advice of the General Office for State Lands and of the Treasury as regards the building of roads, marking of boundaries, etc. The law also contains regulations for the formation of cooperatives.

## UNITED KINGDOM

### MILK MARKET

About a quarter of the value of the agricultural output of the United Kingdom comes from milk. The value of the milk (and dairy produce) output is greater than all cereals and field crops put together and accounts for roughly a third of the total value of all livestock products.

*Value of Milk Output and of Total Agricultural Output <sup>(1)</sup>.*

(1) Excluding state subsidies. (\*) Provisional estimate.

The value of the output in England and Wales, about 70 per cent. of which is sold for liquid consumption, fell heavily in 1931 and 1932, but has been rising steadily in recent years. The rise has been due in the main to an increase in prices realised; the volume of output changed little between 1930 and 1935. In the last two or three years there has, however, been an increase also in the volume of output, of about 3 ½ per cent.; the value of the output has risen at the same time by about 5 ½ per cent.

The cause of the increase of the volume of output must be sought rather in changes in the number of cows in milk than in an improvement in yields, for the latest census made by the Ministry of Agriculture shows no tendency for yields to increase. The

(1) On June 4 each year. — (2) On June 1 each year.

(1) On basis of number of cows and heifers in milk and cows in calf.

Milk is unique among the agricultural products of the United Kingdom by reason of its market position. It is by its nature protected from import competition, and in a country whose imports of agricultural produce exceed in value the national agricultural output, it is the only important foodstuff the home production of which covers the total consumption in the country. This latter fact greatly facilitates the organisation of market control by the producers' monopoly, and thus when the Government in 1931 provided for statutory sanction for such control, marketing schemes for milk were soon evolved.

### Marketing schemes.

*England and Wales.* — The milk marketing scheme, England and Wales, approved by Parliament in 1933, established a Milk Marketing Board representing, and elected by, milk-producers. All sales of liquid milk, other than sales by producer-retailers, are now made through the Board which negotiates prices with purchasers on the basis of yearly contracts. When the Board and the representatives of the milk purchasers, the Central Milk Distributive Committee, fail to agree, prices are established in accordance with the judgement of independent persons appointed for the purpose by the Minister of Agriculture. Different prices are charged by the Board according to the use to which the milk is put, the main distinction being between milk sold for liquid consumption, and milk sold for the manufacture of dairy products, etc. No such difference is, however, made by the Board in the prices it pays to the producers. Before the introduction of the scheme the very low prices received for milk sold for manufacture had put producers selling in this market in a very difficult position, and milk from districts, such as the South West of England, where there was a relatively small market for liquid consumption, began to be diverted to the distant consumption centres. Under the scheme the receipts from the markets are equally shared between producers by means of a pooling system, which is, however, on a regional and not a national basis. In each of the eleven districts into which England and Wales is divided for the purpose, the returns from all sales of milk are pooled and shared between producers on a per gallon basis. The proposal that this pooling system should be on a national basis met with strong objection from districts in which a relatively high proportion of the milk there produced is sold in the more profitable liquid market. A step towards a national equalisation of producers' returns was made by the institution of the Inter-regional Compensation Fund; a levy is made on every gallon of milk sold in the liquid market and the proceeds are used to raise the prices paid by the Board to producers in districts where the proportion of milk sold for manufacture is high.

The *contract prices for the year October 1938 to September 1939* were fixed in September last by an agreement between the Board and the Central Milk Distributive Committee. The *wholesale* prices to be paid to the Board for milk for liquid consumption are, on the average, the same as those paid in 1937-38. Some of the monthly prices are, however, different from those of the last contract, changes having been made to give a greater uniformity throughout the year. The wholesale prices of milk for manufacture are also substantially the same; the prices of milk for butter and cheese manufacture are calculated from a formula based on the price of imported butter and cheese, and these formulae have been modified for 1938-39 in such a way as to give a slightly higher price. The contract also prescribes minimum *retail* prices which vary according to districts. These prices in 1938-39 are to be from  $\frac{1}{3}$  d to  $\frac{2}{3}$  d higher than last year. In all districts monthly prices have been modified to reduce the seasonal differences, and in south-eastern districts with a population exceed-

ing 25,000 there is now a uniform price of 2s. 4d. per gallon. The system of pooling returns introduced by the scheme led to the transfer of milk from the manufacture of butter and cheese on farms, to the Board. In order to check this the Board, in 1934, made arrangements the effect of which is that farmhouse cheesemakers receive a payment from the Board sufficient to cover the difference between the net value of milk sold off the farm and its value if turned into cheese on the farm. No similar scheme was introduced for butter by reason of the administrative difficulties involved; farmhouse cheese-makers were few in number, each producing large quantities, but the position was very different in the case of farm butter-making.

(<sup>1</sup>) Rate for hard cheese; rate for Caerphilly and soft cheese 1  $\frac{1}{2}$ d. less.

(a) Rate for cheese not reaching National Mark standard is  $\frac{3}{4}$ d. less.

Beginning with the year 1937-38 the Board increased its control over the market by regulating the allocation of supplies among purchasers. Previously the purchaser had been free to use his supplies as he wished and this had been detrimental to the interest of the producers in that sometimes, and particularly in the winter of 1936, the markets yielding higher returns were relatively less well supplied than markets yielding lower returns. Thus when the 1937-38 contracts were issued they were accompanied by a letter directing the producer to his market. As part of the 1938-39 contract a plan has been adopted by which the buyers are grouped in three categories, according to the degree to which their businesses are concerned with the liquid and the manufacture market respectively, and the contracts allocated so as to give priority to those serving the more profitable liquid market.

Encouragement of the consumption of liquid milk in England and Wales has been given by the Board in various ways. In 1934 it started a Milk-in-Schools scheme by which milk was supplied at less than the normal retail price, the difference being in part sustained by the Board and in part covered by the subsidy paid by the Exchequer to the Board for publicity expenses (<sup>1</sup>). In May 1935 a publicity campaign was started which in 1936 was directed especially to increasing the consumption of milk by workers in factories. The consumption under the Milk-in-Schools Scheme is about 23,000,000 gallons a year, while the Milk-in-Industry Campaign has increased

(<sup>1</sup>) See page 178.

consumption by workers in factories from less than a 1,000,000 gallons a year when the scheme started, to about 3,500,000 at present.

The cost of these schemes not covered by the Exchequer grant, and of the grants to farmhouse cheese makers and the bonuses paid to producers of special quality milk—to which reference will be made later—and the administrative expenses of the Board, are deducted from the receipts of the Board from the sales of milk, before these receipts are distributed among producers.

Producer-retailers also contribute to the receipts of the Board. A levy is imposed on their sales—which are to the liquid market—representing a share of the cost of operating the scheme and of the burden of the manufacturing market <sup>(1)</sup>.

<sup>(1)</sup> Excluding Government subsidy

<sup>(a)</sup> Estimated.

*Scotland.* — There are three marketing schemes in operation in Scotland; by far the most important is the Scottish Milk Marketing Scheme which is an organization

<sup>(1)</sup> Compare the position in Scotland. See p. 175.

of all producers in Scotland south of the Grampians <sup>(1)</sup>. Here we shall be concerned only with this larger scheme.

The scheme is operated by a Board elected by registered milk producers. All sales of milk, whether to the liquid or manufacturing market, except milk of "Certified" quality <sup>(2)</sup> and milk sold by producer-retailers are made through the Board which pools all the receipts and pays the producers on a per gallon basis. All milk prices are based on a yearly contract between the Board and representatives of milk purchasers. The two parties have not in the past been able to agree on the prices and terms to be fixed by the contract and the matter has therefore had to be referred to an arbitrator.

*The contract prices for the year October 1938 to September 1939 were fixed on the basis of the arbitrator's recommendation. The average for the year of the wholesale prices to be paid to the Board for milk for liquid consumption, is 15  $\frac{1}{12}$ d. per gallon, a little more than  $\frac{1}{3}$ d. per gallon higher than last year. The yearly average of the retail prices for milk for liquid consumption is 25  $\frac{1}{3}$ d. per gallon which is also  $\frac{1}{3}$ d. per gallon higher than last year; this increase is solely in the month of October. Thus the yearly average distributors' margin which had been increased in 1937-38 by  $\frac{1}{4}$ d. per gallon remains the same.*

Special prices are established for "Certified" milk, which is not sold through the Board and for "Tuberculin Tested" milk, which is, since 1937, sold through the Board. The yearly average of the retail prices of "Certified" milk is 33  $\frac{1}{3}$ d. per gallon; the difference between this and the price for ordinary milk is the same as it was last year. The average of the wholesale prices to be paid to producers for this milk is 24  $\frac{7}{12}$ d., and the difference between this and the wholesale price for ordinary milk is slightly less than it was last year. "Tuberculin Tested" milk yields 4d. per gallon more to the retailer and 2  $\frac{1}{2}$ d. more to the Board than ordinary milk. <sup>(3)</sup>

As under the English scheme, farmhouse cheesemakers in the area covered by the main Scottish scheme, receive special bonuses from the Board. Efforts are also being made here to increase milk consumption by a Milk-in-Schools Scheme, and by publicity. Part of the cost of these efforts is met out of the Government subsidy <sup>(4)</sup> and the rest represents a charge on the Board's receipts from sales.

As under the English scheme producer-retailers make contributions to the funds of the Board; and so also do producers of "Certified" Milk who do not sell through the Board. Until 1937 these contributions were on a similar basis to that in England. As a result of an action brought by a farmer which led to a court decision that the Board was not entitled to claim from these producers contributions to the burden of the manufacturing market, the basis was however changed and now the contributions represent a share of the cost of operating the scheme, and of the quality premiums <sup>(5)</sup> only <sup>(6)</sup>.

<sup>(1)</sup> The other schemes are: Aberdeen and District Milk Marketing Scheme concerned with sales of about 9,000,000 gallons a year, and the North of Scotland Milk Marketing Scheme, with sales of a little over 2,000,000 gallon per year. The sales of the Scottish Milk Marketing Scheme are at present over 120,000,000 gallons a year.

<sup>(2)</sup> See page 180.

<sup>(3)</sup> See page 180 for difference in return to producer.

<sup>(4)</sup> See page 178.

<sup>(5)</sup> Since 1938.

<sup>(6)</sup> The rate is now 1  $\frac{3}{4}$  d. per gallon.

*Northern Ireland.* — The position in Northern Ireland is very different from that in Great Britain; whereas almost 70 per cent. of the milk produced in Great Britain is sold for liquid consumption, only about 30 per cent. of the production in Northern Ireland goes to the "liquid" market. A marketing scheme was introduced in Northern Ireland by the Milk and Milk Products Act (Northern Ireland) in June 1934. This differs fundamentally from the English and Scottish schemes. There is no producers' marketing monopoly, but instead a Joint Milk Council consisting of 3 representatives of the Ministry of Agriculture, 3 representatives of consumers appointed by the Minister of Home Affairs, 7 members elected by producers and 4 members elected by distributors. This Council fixes retail and wholesale prices for milk for liquid consumption. There is no collective marketing and pooling of receipts. Instead there is provision for

"equalisation payments" to be made to producers of milk for manufacture, in order to bring the prices realised up to a guaranteed minimum; the funds for the purpose are obtained from a levy on sales of liquid milk for liquid consumption and on sales of butter and margarine, and from any sums paid by the Exchequer of the United Kingdom to assist the milk industry in Northern Ireland. Milk for the liquid and manufacturing markets is separated on a quality basis; four grades are established and the lower grade, D, may not be sold for liquid consumption.

Wholesale prices for milk for liquid consumption for the period October 1, 1938-September 30 1938, are the same as in 1937-38. They are 1s. 3d. per gallon from October 1 to April 30, and 1s. 1d. from May 1 to September 30; these are the prices for Grades B and C, those for Grade A are 2d. higher. Retail prices which vary not only according to quality but also according to district have been increased by extending the higher winter prices for an additional three months and so shortening the summer period to the months of June and July; the highest prices, to rule in the large towns of Belfast and Londonderry and elsewhere, are:— from October 1 to May 31, 2s. 2d. per gallon for Grade A, 2s. Grade B, 1s. 10d. Grade C, and from June 1 to July 31, 2s., 1s. 10d. and 1s. 8d. respectively. The distributors margin will be about  $\frac{1}{2}$  d per gallon higher in 1938-39.

The price guaranteed to producers of milk sold for manufacture — mainly to creameries — is 5d. per gallon in the summer months April to September and 6½ d. in the winter months. If the milk so sold is Grade A, B or C the producer receives a bonus of 2d. per gallon from the Milk Fund.

*Milk sold to Creameries for Manufacture - Northern Ireland*

	1934-35	1935-36	1936-37	1937-38
Quantity. Thousand gallons . . . . .	18,761	24,433	25,673	23,391
Average prices paid by creameries. Pence per gallon. . . . .	3.18	3.99	4.38	5.12
Average amount of Equalisation Payments: Pence per gallon . . . . .	2.15	1.35	0.90	0.35
Receipts from milk supplied to creameries:—	£	£	£	£
Paid by creameries . . . . .	256,548	413,415	476,420	499,434
Equalisations payments . . . . .	168,105	135,378	96,199	34,405
Quality bonus. . . . .	1,501	24,256	37,235	48,230
Total . . .	426,154	573,049	609,854	582,069

The amount of milk converted into butter on farms is estimated at about 28,000,000 gallons; thus the total quantity of milk used for manufacture of butter is between 50,000,000 and 55,000,000 gallons. Liquid consumption is estimated at about 30,000,000

gallons, and about half of this probably is consumed on farms. The contract prices fixed for liquid milk relate therefore to only a small percentage of the total milk output.

*Prices fixed for Milk Liquid Consumption - Northern Ireland.*

### Government subsidies to the milk industry.

The Milk Acts, 1934-37 provide for payments from the Exchequer to the Milk Marketing Boards in England and Wales and in Scotland and to the Government of Northern Ireland. The payments have the purposes, first, of guaranteeing to the wholesale sellers of milk minimum prices for milk for manufacture<sup>(1)</sup>; second, of giving financial assistance to schemes for increasing the demand for milk <sup>(2)</sup>; and third, of financing a scheme for the improvement of the quality of milk <sup>(3)</sup>. It is to be noted that payments made to guarantee minimum prices for milk for manufacture were to be gradually repaid to the Exchequer when the prices of such milk rose above the guaranteed minimum.

<sup>(1)</sup> About £ 3,000,000 was paid by the Exchequer on this account during the period 1934-35 to 1937-38.

<sup>(2)</sup> The Act provided £ 1,000,000 to be spent over two years; a further £ 500,000 was made available in each of the two years 1936-37 and an Amendment Act of 1938 provided £ 750,000 for 1938-39.

<sup>(3)</sup> The Act provided £ 750,000 to be spent over 4 years. The relevant section of the Milk Act was repealed and replaced by a section of the Agriculture Act 1937, which provided for the payment from the Exchequer of a bonus of 1d. per gallon on milk from herds free from tuberculosis.

The provisions of these Acts expired on September 30, 1938 and as there was no prospect of the Government's proposals for a long-term measure being put into legislative effect before that date, a Milk (Extension and Amendment) Act was passed in July 1938. This extended till September 30, 1939 the provisions of existing Acts and made the following amendments to them.

First, the Milk Marketing Boards are released from all liability accruing after September 30, 1937, to repay to the Exchequer advances made in respect of milk for manufacture.

Second, the provisions of existing Acts, are enlarged to allow the development of the existing schemes for the provision of cheap milk to school children and children under school age and to expectant and nursing mothers, and for this purpose the Exchequer is to provide during the year £ 750,000, *i. e.* 50 per cent. more than the £ 500,000 hitherto made available annually.

### Quality premiums.

The efforts made in recent years in the United Kingdom to encourage the improvement of the quality of the milk output, by means of various quality premiums paid by the Milk Marketing Boards and by the Exchequer, have been intensified recently.

Before the introduction of the milk marketing schemes there was in force an officially controlled system of special designations set up by the Milk (Special Designations) Order, 1923 <sup>(1)</sup>; this gave five grades of milk and many buyers were prepared to pay a higher price for milk of a higher grade.

New direct incentives to the improvement of the quality of milk produced were introduced in 1935. First, the Milk Marketing Board for England and Wales began to compile a roll of Accredited Producers; this is a roll of producers whose production came up to certain standards approximately the same as the Grade A standard set up in 1923 <sup>(1)</sup>—the cows have to be submitted to a veterinary examination at intervals of not more than six months, the milk has to comply with certain bacteriological standards, and the methods of production have to be approved by county authorities—; Accredited producers were given the right to a bonus of 1*d.* per gallon, paid out of the funds of the Board, on all milk they sold through the Board. Second, the Minister of Agriculture began an Attested Herds Scheme <sup>(2)</sup>; producers whose herds showed no reactors to an official tuberculin test repeated at six-monthly intervals became entitled to a bonus of 1*d.* per gallon, paid by the Exchequer <sup>(3)</sup>, on milk sold for liquid consumption. The conditions of the test and the regulations which the holders of an Attested Herd certificate have to follow are more severe than those of the Accredited scheme. The Attested Herd bonus is payable in addition to any bonus the producer might receive under the Marketing Board's Accredited Scheme <sup>(4)</sup>.

---

<sup>(1)</sup> See the September 1938 number of this Chronicle p. 440.

<sup>(2)</sup> This scheme is in operation in England and Wales and Scotland.

<sup>(3)</sup> In accordance with the Milk Act, 1934 and later the Agriculture Act, 1937; see page 178.

<sup>(4)</sup> The output of Accredited milk was 280,024,000 gallons in 1935-36, 336,610,000 in 1936-37 and 376,585,000 in 1937-38. The output of milk in England and Wales from Attested Herds was in November 1938 2,000,000 gallons, which is times that in November 1937.

The producers of milk of the two highest grades set up by the 1923 Order, that is "Certified" and "Grade A Tuberculin Tested", were until 1937 exempt from the marketing schemes; they sold their milk independently and not through the Boards, receiving in general higher prices than those paid for lower grade milk sold through the Board. In 1937 the position was changed.

In the meantime the special designation regulations had been modified. Orders made in 1936 established three special grades for England and Wales—"Tuberculin Tested", "Accredited" and "Pasteurised"—and four grades for Scotland—"Certified", "Tuberculin Tested", "Standard" and "Pasteurised". Licences to produce "Tuberculin Tested" milk are granted to a producer on condition first, that official tests repeated at six-monthly intervals show his herd to be free from tuberculin reactors—a test similar to that required by the Attested Herds Scheme—and second, that the milk produced passes certain bacteriological tests—the form of the test in Scotland is different from that in England and Wales. The conditions for the production of Certified milk in Scotland are similar, but the bacteriological test is more severe and certified milk has to be bottled on the premises where it was produced, immediately after production and cooling, whereas T. T. milk may be transported to other premises for bottling. Herds from which Accredited milk, in England, and Standard milk in Scotland, are produced, have to be submitted to a veterinary examination—similar to that required by the Accredited Producer scheme—at intervals of 3-5 months and to be shown to be free from diseases likely to affect the milk injuriously; this examination does not include the official tuberculin test. The milk produced has to pass a bacteriological test; in Scotland the standard required for Standard milk is the same as that for T. T. milk; in England and Wales, where the test is on a different basis, the standard for Accredited milk is lower than that for T. T. milk.

*Quality Premiums Paid by the Milk Marketing Board, England and Wales.*

	Before October 1938		After October 1938	
	Total	Government contribution	Total	Government contribution
Accredited Milk . . . . .	1	—	1 ¼	¾
Tuberculin Tested Milk . . . . .	2	—	2 ¼	1 ¼
Milk from Attested Herds . . . . .	1	1	2	1 ½
Accredited Milk for Attested Herds . . . . .	2	1	3 ¼	2 ¼
Tuberculin Tested Milk from Attested Herds .	3	1	3 ¼	2 ¼

In 1937 producers of T. T. milk were brought within the marketing schemes in England and Wales and in Scotland; they acquired the same benefits and liabilities as

other producers in the scheme had. They became entitled to a bonus of 2d. per gallon payable out of the funds of the Boards, on their wholesale sales, which are now made through the Board.

In the summer of 1938 the Attested Herds scheme was extended <sup>(1)</sup>.

(a) Includes 1d provided for by the Government's Attested Herds scheme.

Now, for the present contract year, which began in October 1938 a new scale of quality premiums has been established. The rates payable in England and Wales have been increased, and in Scotland rates are increased and new premiums introduced.

<sup>(1)</sup> See the September 1938 number of this Chronicle p. 439-440.

These increased premiums are based on the Government proposals for a long-term milk act; the Government announced that if the Milk Marketing Boards decided to pay quality premiums on scales corresponding to that set out in the published proposals the Government would commend to Parliament that provision should be made in the proposed Milk Industry Bill authorising payment retrospectively to October, 1938 of Exchequer contributions towards the cost of the premiums <sup>(1)</sup>.

---

<sup>(1)</sup> A Milk Industry Bill was introduced at the end of 1938 but was withdrawn in face of strong opposition particularly from the English Milk Marketing Board. The Board objected to the control of the milk industry by a proposed non-representative milk commission and found that the proposed prices to be guaranteed for milk for manufacture were much too low. The Government are at present reconsidering the position.

## TRADE RELATIONS OF THE U. S. S. R. WITH WORLD AGRICULTURAL MARKETS

SUMMARY: — *Export trade in wheat*: — 1. Situation before the War. — 2. Exports in relation to output of wheat in Russia. — 3. Exports of wheat from Russia in relation to exports from the principal wheat exporting countries. — 4. Effects of the urbanisation of Russia on the home demand for wheat. — 5. Comparison of changes in the output of wheat and demographic changes in the principal wheat-producing countries. — 6. Export markets for Russian wheat before and since the War. — 7. Increasing self-sufficiency of the wheat importing countries. — 8. The future of Russian wheat exports. — *Export trade in flax* — *Export trade in butter*.

## II. — International trade in agricultural products.

### Export trade in wheat.

I. — *Situation before the War*. — Before the War, wheat played a very important part amongst Russia's agricultural exports, so that the large annual exports of this cereal combined with its excellent quality made Russia the "granary of Europe".

These exports represented as much as 14 per cent. of the total wheat output in the pre-War territories of Russia and 22 per cent. of the output of the territories within the present boundaries of Russia. However some doubts may well arise as to whether these immense exports formed a real surplus over the food requirements of the Russian people.

The following table shows the annual average wheat consumption per head in Russia compared with that in several other countries for the five-year period 1909-14.

TABLE IX. — *Consumption of Wheat in certain Countries.*  
(Quintals per head).

Russia . . . . .	0.89	Belgium . . . . .	1.78
Romania . . . . .	1.16	France . . . . .	2.20
Hungary . . . . .	1.19	United States . . . . .	1.35
Serbia . . . . .	1.25	Canada . . . . .	1.41
United Kingdom . . . . .	1.51	Australia . . . . .	1.42
Italy . . . . .	1.62	Argentina . . . . .	2.28

(Appendix to the *International Wheat Situation*, issued by the Secretariat of the Wheat Advisory Committee. January 1938).

Thus the per capita consumption of wheat in Russia was substantially smaller than in overseas, as well as in European countries. The consumption of rye too, which is the staple cereal food in Russia, was lower than in many European countries where rye formed the main cereal food. The per capita consumption of rye in 1906-07 was 79.8 kg. in Russia, 143.0 kg. in Germany, 227.4 kg in Denmark, etc. In 1913-14, on the eve of the War, the corresponding figures were 120.4, 152.4 and 218.0 kg. respectively <sup>(1)</sup>.

Though these figures are only approximate, they are nevertheless very characteristic when considered over a number of years.

As said in Part I, a large part of the foreign loans had to be paid for with exports of cereals, which were the principal item in the balance of trade, representing 40 per cent. of total exports; for even the gold standard introduced at the end of the 19th century by Witte, the Minister of Finance, had to be protected against excessive fluctuations if it was to retain the confidence of the holders of Russian bonds. In this regard, therefore, considerations of social welfare tended to be subordinated to commercial requirements.

A comparison of present-day exports of wheat from Russia with pre-War exports is not altogether appropriate. For even before the War, in the so-called golden age of Russian wheat, exports of wheat from Russia were being affected by the pressure on the world market from overseas countries. This is clearly demonstrated in the following table, which gives the exports of wheat from the five principal exporting countries for the years from 1905 to 1913.

TABLE X. — *Exports of Wheat from the five principal Exporting Countries.* <sup>(2)</sup>  
(Thousands of quintals).

Year	Russia	Canada	United States	Australia	Argentina
1905 . . . . .	48,131	7,803	5,644	6,708	28,683
1906 . . . . .	36,036	10,379	17,106	8,236	22,480
1907 . . . . .	23,207	10,207	24,871	7,834	26,808
1908 . . . . .	14,710	14,289	25,251	4,090	36,363
1909 . . . . .	51,511	13,452	13,197	8,586	25,141
1910 . . . . .	61,360	12,635	6,602	12,999	18,836
1911 . . . . .	39,402	16,459	8,891	15,009	22,860
1912 . . . . .	26,376	23,122	16,780	8,873	26,291
1913 . . . . .	33,294	35,367	27,082	11,682	28,122

As is shown by these figures, in the period 1905-13 exports of wheat remained more or less constant only in Argentina, where, in fact, they even fell somewhat. Exports from Australia almost doubled, while those from Canada and the United

<sup>(1)</sup> International Yearbook of Agricultural Statistics, 1913-14. International Institute of Agriculture, 1915, p. 521-540.

<sup>(2)</sup> Ibidem, pp. 252-253.

States increased fivefold. Over the same period, exports of wheat from Russia decreased year by year, except for 1909 and 1910, when harvests were exceptionally good, amounting respectively to 230,288,000 and 227,587,000 quintals, compared with 173,168,441 quintals in 1905. <sup>(1)</sup>

In 1905 exports from Canada had still barely reached a sixth of the Russian figure; but by 1913 they had overtaken those from Russia. Basing the index of Russian wheat exports on 1905 = 100, the index rose above 100 twice, in 1909 and 1910, when it was 107 and 127.5 respectively. In all the other years it was lower, reaching for the years 1911, 1912 and 1913 only 81.9, 54.9 and 69.2 respectively. Taking the average for the years 1909-13, however, Russia remained in absolute figures the greatest supplier of wheat in the world, though her position on the world market was being more and more contested.

2. - *Exports in relation to output of wheat in Russia* — The following table shows the quantities exported and the output of wheat in Russia during the last quarter of a century.

TABLE XI. — *Russian Exports of Wheat and Flour.*  
(Thousands of quintals).

Calendar years	Output	Years (commercial season)	Exports	Percentage of exports to output
1909-1913 <sup>(1)</sup> average.	206,025 (100)	1909-10 to 1913-14 average	44,689 (100)	21.69
1923-1927 " "	184,200 (89.41)	1923-24 to 1927-28 " "	4,500 (10.07)	2.40
1928-1932 " "	217,000 (105.33)	1928-29 to 1932-33 " "	10,900 (24.39)	5.02
1933-1937 " "	328,220 (159.31)	1933-34 to 1937-38 " "	6,100 (13.65)	1.85
1933 . . . . .	277,300	1933-34 . . . . .	9,400	3.39

<sup>(1)</sup> The figures for the pre-War period refer only to the territories within the present boundaries of the U. S. S. R.

<sup>(1)</sup> International Yearbook of Agricultural Statistics, 1913 and 1914. International Institute of Agriculture, Rome, 1915, p. 23.

This table shows how completely the position has changed as regards exports of wheat from Russia since the War. Taking the pre-War average 1909-13 = 100, the index number for exports of wheat during the NEP period 1923-24 to 1927-28 (grain again being exported from 1924) sank to 10.07. During the first Five Year Plan, 1928-32, it rose to 24.39, to fall again to 13.65 in the second Five Year Plan, 1933-37. The proportion between wheat exports and output fell from 21.7 per cent. to only 1.85 per cent. in 1933-37. Compared with the pre-War period, the output of Russian wheat increased during the first and second Five Year Plans while exports were falling off considerably.

3. - *Exports of wheat from Russia in relation to exports from the principal wheat-exporting countries.* — Table XII shows the general conditions on the world market and the movement of wheat exports from the U. S. S. R. compared with those from the other more important exporting countries for the periods 1909-13, 1923-27, 1928-32 and 1933-37.

An analysis of the various sources of supply of the world wheat market and of their altered relationships over the last twenty-five years is particularly instructive. The average contribution to the world market of Russian wheat over the five years 1909-10 to 1913-14 was 24.3 per cent., almost one quarter of the total world supply. Next, though at a considerable distance, came the United States and the Danubian countries (Bulgaria, Romania, Serbia and Hungary), each contributing about 16 per cent. Canada followed with 14 per cent.; Argentina with 12.4 per cent., while Australia supplied only 8 per cent. These countries were together responsible for about 91 per cent. of the wheat placed on the world market.

During the War Russia had only to supply her own needs, the world market remaining completely shut off. Meanwhile the overseas countries were steadily expanding their exports, and their increased importance for the world market became an established fact. This alteration in the relation between the different exporting countries underwent further change in subsequent years. Exports of wheat from the post-War U. S. S. R. territory diminished in the NEP period (1923-24 to 1927-28) to 12.08 per cent. of the pre-War level—much below that of the Danubian states whose exports fell only by two-thirds (to 32.33 per cent.) of the pre-War level. The percentage of Russian wheat exports to world exports fell to 2.5 per cent.

During the first Five Year Plan (1928-29 to 1932-33) exports of wheat from Russia more than doubled in comparison with exports in the NEP period. They still remained far below the pre-War level, however, amounting to only about a quarter of Russia's pre-War wheat exports. Russia's contribution to the world wheat market was 5.4 per cent, somewhat lower than the 6 per cent. supplied by the Danubian States. In the years 1933-34 to 1937-38 it fell to only 4.1 per cent.

Of the other countries, the United States increased her exports considerably, the export index rising to 157.57 for the period 1923-27, while her share of world wheat exports rose from 16.1 per cent. in 1909-13 to 21.9 per cent. in 1923-27. In the next two periods; however, as a result of the decline in the

TABLE XII. — *Exports of Wheat and Flour (1) from Russia and the other principal Wheat-Exporting Countries.*  
(Thousands of quintals).

Average	Total world exports of wheat	U. S. S. R.		United States		Canada		Argentina		Australia		Panama States	
		Volume	% of world exports	Volume	% of world exports	Volume	% of world exports	Volume	% of world exports	Volume	% of world exports	Volume	% of world exports
1909-10-1913-14 . . .	184,300 (100)	44,700 (100)	24.3	29,700 (100)	16.1	25,800 (100)	14.0	22,000 (100)	12.4	14,900 (100)	8.1	30,000 (100)	16.3

1928-29-1932-33 . . .	207,600 (112.64)	11,200 (25.05)	5.4	29,600 (99.66)	14.3	72,000 (279.67)	34.7	41,800 (182.53)	20.1	33,800 (226.84)	16.3	12,400 (41.33)	6.0
1933-34-1937-38 . . .	147,500 (80.03)	6,100 (13.65)	4.1	7,900 (26.60)	5.4	48,000 (180.53)	33.2	34,300 (149.78)	23.3	27,900 (187.25)	18.9	12,100 (40.33)	8.2

(1) Flour reduced to grain on the basis of the coefficient: 1 quintal of flour = 1.33333 quintals of grain. International Yearbook of Agricultural Statistics.

output of wheat, the export index fell just below 100 and subsequently to only 26.6, whilst at the same time the U. S. A. share in world exports fell to 14.3 per cent. and then to 5.4 per cent., thus sinking to nearly as low a level as exports of Russian wheat during the same period.

Exports from Argentina showed increases in both the first two periods considered here, export indices being 168.56 and 182.53 respectively; in the last five years, however, the index number fell below 150. Meanwhile her share in world exports rose continually, from 12.4 per cent. in 1909-13 to 18.1 in 1923-28 to 20.1 in 1928-32 and to 23.3, or nearly a quarter of the world trade in 1933-37.

Australia shows the second largest increase with an export index of 165.10 in the first, 226.84 in the second and 187.25 in the third post-War period, the percentage share in world trade being respectively 11.5, 16.3 and 18.9 for the same periods.

Canada's export index rose above 309 for the years 1923-24 to 1927-28 and shows the largest increase; but after the crop failures of 1929 and 1931 and in 1936 and 1937 especially, the index fell to 279.07 and 189.53. Nevertheless Canada still remained the largest exporter of wheat, its share in world exports rising from 14 per cent. before the War to 37.4 per cent and falling to 33.2 per cent. in the last period. Thus Canada, which before the War had been the fourth largest exporter of wheat, coming after Russia, the Danubian states and the United States, now rose to first place on the world wheat market, previously held, as has been shown, by Russia, who after the War fell to the sixth and last place among the great wheat-exporting countries.

Thus after the War exports of wheat from Russia to the world market were intermittent and had to compete with the greatly increased surpluses of the other exporting countries. They were therefore unable seriously to influence the altered structure of the world wheat market.

4. - *Effect of the urbanization of Russia on the home demand for wheat.* — These changes in wheat exports reflect the present tendency towards stagnation in the international trade in wheat. Nevertheless, the fundamental causes of the decline in Russian exports are to be found in the economic conditions of Russia herself. The output of wheat, though it rose after 1925, lagged behind in comparison with the rate of increase of the urban population. For the number of town dwellers was increasing fairly rapidly, and the industrial and office workers, etc. had to rely mainly on the State for their supplies of food.

In 1937 34.7 per cent. of the total population of the U. S. S. R. consisted of workers and employers, 55.5 per cent. of *kolkhos* peasants and cooperative artisans, 5.6 of non-collective peasants and non-cooperative artisans, and 4.2 per cent. of students, soldiers, invalids and old-age pensioners etc. The changes in occupation resulting from alterations in the economic structure of the country were so great that the urban population rose from 25 million in 1913 to about 60 million in 1937. Thus the number of town-dwellers has more than doubled.

Under the new régime private enterprise was eliminated and every variety of economic activity increasingly concentrated in the hands of the State. The Central Government was therefore obliged, if the effectiveness of the general

economic plan was to be ensured, to try to eliminate as far as possible any disharmony between production and consumption of the various goods. The responsibility for the food supplies of the people lies on the planning committees, so that exports can not easily proceed unregulated. Before the War wheat exporting came within the scope of private enterprise, the rôle of the State being only indirect, but since then the conception of the rights and obligations of the State has changed radically.

5. — *Comparison of changes in the output of wheat and demographic changes in the principal wheat-producing countries.* — A comparison between the outputs of wheat of the chief producing countries shows that Russia's production has been larger absolutely than that of any other country both before and since the Revolution. The only exception to this was during the NEP period and the first Five Year Plan, when the average output of the United States was greater than that of the U. S. S. R. In general, Russia remains to-day, as it was before the War, the world's greatest producer of wheat. It must of course be remembered that her population in 1935 was about 168 million, whereas the populations of the United States, Argentina, Canada and Australia were respectively 127.2 million, 12.4 million, 10.9 million and 6.8 million — amounting in all to 157.3 million.

In the last 25 years the shares of the chief wheat-producing countries in the world output of wheat have undergone great changes. This is shown in Table XIII, which gives both relative and absolute figures for the pre-War and NEP periods and for the two Five Year Plans (1928-32 and 1933-37).

These figures show the changes that occurred in world wheat production and also in the output of each of the five most important producing countries in comparison with the world production of wheat. On the basis 1909-13 = 100 we find that the index for the volume of world production in 1928-32 had risen above 120, an increase of over a fifth.

Russian production has also increased, though more slowly than world production. The index number rose to 105.34 during the first Five Year Plan, an increase which was 14.46 per cent. less than the world increase.

During the same period the index number for wheat production in the United States rose to 125.29, thus exceeding the index number for the world output by 5 per cent.

The wheat indices for other countries also show big changes. Canada's output of wheat more than doubled in the twenty year period under consideration, the index for 1928-32 standing at 208.77, which is considerably higher than the world index. Argentina's output also increased very greatly, the index for 1928-32 having risen to 164. Finally, in the same period Australia's wheat index rose to 200, a doubling of her output.

Corresponding to the varying degrees of increase in wheat production in these countries, their shares in world output also changed somewhat. Russia's share fell about 2.4 per cent. below the pre-War figure. In the same period the United States share rose from 17.75 to 18.56, per cent., Canada's from 5.1 to 8.8, Argentina's from 3.78 to 5.18 and Australia's from 2.33 to 3.88.

TABLE XIII. — *Wheat Production in Russia and in the principal Wheat-producing Countries.*

(Thousands of quintals)

Years (average)	World wheat production	Russia /U. S. S. R.		United States		Canada		Argentina		Australia	
		Volume	% of world total	Volume	% of world total	Volume	% of world total	Volume	% of world total	Volume	% of world total
1909-13 . . . . .	1,058,000 (100)	206,000 (100)	19.47	187,800 (100)	17.75	53,000 (100)	5.07	40,000 (100)	3.78	21,000 (100)	2.33
1923-27 . . . . .	1,131,600 (106.95)	184,200 (89.42)	16.28	210,500 (115.28)	19.13	109,900 (205.04)	9.71	62,200 (155.50)	5.50	37,200 (151.22)	3.29
1928-32 . . . . .	1,267,500 (119.80)	217,000 (105.34)	17.12	235,300 (125.29)	18.56	111,900 (208.77)	8.83	65,000 (164.00)	5.18	49,200 (200.00)	3.88
1933-37 . . . . .	1,318,320 (124.60)	328,220 (159.33)	24.90	174,600 (92.97)	13.24	67,400 (125.00)	5.11	60,000 (150.00)	4.55	43,200 (175.61)	3.28

These fluctuations in the output of wheat between the years 1909-13 and 1928-32 are of special interest, because they show how the trends of population and of the output of wheat in these countries have diverged from one another.

In contrast to the countries showing the largest increases in their output of wheat, the U. S. S. R., whose share in world production fell from 19.5 to 17.1 per cent. between the two periods in question, has a very high coefficient of increase of population. According to Dr. R. R. Kuczynski the net reproduction rate, which is the most exact method of expressing the balance of births and deaths, is "enormous and hardly lower than it ever was, since mortality probably has decreased about as much as fertility". Together with Japan, the U. S. S. R. with a net reproduction rate of 1.4 shows the highest coefficient of increase of population of any country. In the United States and Argentina the net reproduction rate lies between 0.8 and 1.0, in Canada between 1.2 and 1.4 <sup>(1)</sup> whilst in Australia it is 0.96 <sup>(2)</sup>. Thus despite the fact that these countries tend to augment their populations by immigration from abroad, their net reproduction rates are below that of the U. S. S. R.

Though such comparisons cannot be made with absolute precision they do show the general trend, which is of the utmost significance for our present argument.

This marked tendency of wheat production in the principal wheat-exporting countries to increase relatively to the trend of population was not apparent during the period of the second Five Year Plan. This was due to the United States wheat output in the four year period 1933-36 having been exceptionally low on account of the unusually unfavourable natural conditions. Not only was it lower than the average American output for the five years 1923-27, but it was also below the 1909-13 figure, being only 93 per cent. of the pre-War volume of production. This abnormal fall in the United States output of wheat led to a substantial reduction in exports during 1933 and 1934, and in 1935 and 1936 even caused the United States to import 16.6 million quintals of wheat—a phenomenon the like of which has not occurred throughout the recent history of the country.

As a result of drought Canadian harvests throughout these five years were also very seriously affected. Thus the largest crop in the five years 1933-37, that of 1933, was only 76 million quintals. This is lower than the smallest crop for the five years 1928-32, which occurred in 1929 and amounted to 83 million quintals. The index number for wheat output fell from 208.77 in the first five years to 125 in the second period.

At the same time, however, in Russia natural conditions combined with the improvements in the utilisation of labour so as almost to make certain for each year of the second Five Year Plan, (1933-37) of harvests which were

---

<sup>(1)</sup> *The Population Problem* by T. H. MARSHALL, Prof. A. M. CARR-SAUNDERS, H. D. HENDERSON, R. R. KUCZYNSKI, Professor ARNOLD PLANT. London, 1938, p. 113-115.

<sup>(2)</sup> *Population and Social Problems. International Labour Review*, I.L.O. Geneva, March 1939, p. 302.

exceptionally good—much larger indeed than previously, either before or after the War. Russia's share in the world output of wheat in 1933-37 was therefore very high, 25.5 per cent., and the production index jumped to 159.3. But although these changes in wheat production in the years 1933-37 are very important in themselves, they scarcely affect the general picture of the trend of world wheat production in the principal producing countries since the War, considered from the point of view of demographic changes.

The low net reproduction rate, and the large harvests of wheat in the most important overseas producing countries which accompanied it, are amongst the characteristic tendencies of the War and post-War years, which are reflected by the altered importance of various countries for the world wheat market. The margin between the volume of exports and internal requirements in these countries is much broader than in the Soviet Union, so that a decrease only effects them indirectly, through the balance of trade.

In the U. S. S. R. on the other hand the rate of increase of wheat production has been lower and the net reproduction rate higher than in the overseas countries. In contrast to the other countries, therefore, the problem of increasing the output of wheat is not primarily one of commercial policy and the need to export, but, for the immediate future at least, mainly a matter of securing an adequate food supply to the population at home—especially when it is recalled that the per capita consumption of wheat in the U. S. S. R. has risen from 0.89 quintals for the five year average 1909-14 to 1.11 quintals for the five year average 1932-37.

During the same period the per capita consumption of wheat in the overseas countries has, for various reasons, fallen off, in Argentina from 2.80 to 2.10 quintals, in Australia from 1.42 to 1.33 quintals, in Canada from 1.41 to 1.09 quintals, and in the United States from 1.35 to 0.99 quintals.

The total quantity of wheat used in Russia for human nourishment increased from 119 million quintals for the average of the years 1909-14 to 189 million quintals for the average of the years 1932-37—a rise of almost 60 per cent. <sup>(1)</sup>.

This probably also accounts for the Soviet Union's not undertaking any engagement with the London International Wheat Agreement of 1933 to restrict her production of wheat.

From 1909-13 to 1932-36 the population of Russia increased from an average of 134 million to 169.3 million, giving an index for the latter period (1909-13 = 100) of 126.41. If, therefore, we allow for this increase in population and take as normal the pre-War proportion of exports to output of 22 per cent. (actually it was 21.69 per cent.), then theoretically, with a total output of 328 million quintals, exports for the average of the years 1933-37 should have been 52.8 million quintals or 17.2 per cent. <sup>(2)</sup> of output, as against the actual figure of 1.85 per cent.

<sup>(1)</sup> Appendix to the *International Wheat Situation*, issued by the Secretariat of the Wheat Advisory Committee, January 1938.

<sup>(2)</sup>  $\frac{44.7 \times 100 \times 328}{206 \times 126.4} = 52.8$  million quintals, or 17.2 per cent. of the output of wheat (328 million quintals).

Russia could have gained entry to the world market by price cutting as she did in 1930, when she endeavoured, in order to obtain exchange for payment for the necessary imports of machinery, to market wheat from the abundant crop of that year at low prices. What was then an economic necessity, however, would have been during the second Plan, 1933-37, a luxury and indeed an economic absurdity. For not only had her demand for industrial goods from abroad fallen off, but wheat prices were chronically bad, being not only below the pre-War level, but below the average price for 1928-32 too. Thus for the U. S. S. R. price dumping is a two-edged weapon and its effect most problematical.

Russian exports of wheat, which at first sight appear to involve only a special problem, are thus seen to be of general interest, and to lead to important questions of principle relating to world economic organization.

6. — *Export markets for Russian wheat before and since the War.* — Table XIV. shows the principal markets to which Russian wheat was exported before the War, giving relative figures for the quantities exported for each year from 1905, until the War <sup>(1)</sup>.

As can be seen from the table, before the War Holland, Italy and the United Kingdom were the largest importers of wheat from Russia. Holland took almost a fifth, and sometimes more, of the Russian output, but a considerable part of this only entered Holland in transit awaiting re-export. In Italy Russia's hard wheat was very popular, especially for the production of macaroni, and had gained great renown, so that in 1905 Italy took over a fifth of total Russian exports of wheat and in 1913 this percentage rose to almost a third. Together, Italy and Holland imported over a half (52.5 per cent.) of Russian exports of wheat.

The United Kingdom came third, taking a quarter of the exports in 1905, though this figure had fallen to a tenth in 1913, her imports from Canada, the United States and Australia having substantially increased during this period. France held fourth place, importing respectively 9.4 and 15 per cent. of the Russian exports in these two years. Imports of Russian wheat into Germany before the War remained for the most part fairly stable, amounting to 6.15 per cent. in 1905 and 5.8 per cent. in 1913. After this came the less important markets of Spain, Greece, Belgium, Sweden, etc.

In recent years the destination of Russian exports has undergone a very considerable change, as Table XV shows. The most important market for Russian wheat is now the United Kingdom, which took more than a third (35 per cent.) in 1930 and more than a half (52.4 per cent.) in 1935 of all Russian exports of wheat. Italy was until recently one of the most important markets and in this period came second only to the United Kingdom. In 1930 she took 14 per cent. and in 1934 15.4 per cent. of the Russian wheat exports. In 1935 and 1936, however, the wheat trade between these two countries fell off almost completely. In the meantime the Greek market had greatly increased its importance,

<sup>(1)</sup> From the International Yearbook of Agricultural Statistics, 1915, p. 194.

imports rising from 2.3 in 1930 to 51.5 per cent. in 1936. In 1930 Germany imported 14.3 per cent., almost as much as Italy, and in 1934 the figure rose to 15.8 per cent. In 1935 however imports fell to 0.02 per cent., and were reduced practically to zero in 1936.

Belgium, on the other hand, has greatly increased her importance as a market for Russian wheat, taking 15.6 per cent. in 1936. The Netherlands also imported the very considerable quantity of 6.5 per cent. in 1935. Certain new markets for Russian wheat have also made their appearance, such as Norway, Finland, Estonia, etc.

France has lost much of the importance she had before the War as an importer of Russian wheat and, incidentally, not of Russian wheat alone. In 1935 she took only 1 per cent. of the total exports of wheat from Russia. French imports of wheat fell from an average of 12.8 million quintals in 1928-29 to 1932-33 to only 1.7 million quintals from 1933-34 to 1937-38. Indeed, in 1934, after a series of good harvests, France herself exported some 4.8 million quintals.

Thus not only has the volume of Russian exports of wheat greatly altered in comparison with the pre-War period, but the importing countries themselves have altered their importance as importers of wheat.

7. - *Increasing self-sufficiency of the wheat-importing countries.* — The position of Russian, as of world exports of wheat in general, has been greatly affected by the policies of those countries which formerly took their additional wheat requirements from the world market, but which now attempt as far as possible to satisfy their needs by expanding home production.

According to investigations by the International Institute of Agriculture, the following are the declines in the percentages of wheat imported to total supplies of wheat in the consuming countries:— In the United Kingdom and Ireland from 80.3 per cent. for the average of the years 1923-24 to 1927-28, to 76.4 per cent. for 1933-34 to 1937-38; for the same years in France from 14.4 per cent. to 2 per cent; in Italy from 27.5 per cent. in 1923-24 to 1927-28 to 6.3 in the second period given; for Germany and Austria from 42.4 per cent. to 11.3 per cent. for the same period; and in the Netherlands, from 84.3 to 59.0 per cent. for the same period <sup>(1)</sup>.

By increasing their own output, the importing countries made themselves more and more self-sufficient; foreign wheat was admitted only in greatly reduced quantities as a result of far-reaching measures of restriction such as high tariffs, import quotas for foreign wheat, subsidies to encourage the milling of domestic grain, etc.

Other factors, such as the trade and tariff policies of many of the exporting countries, monetary problems, etc. have also had their effect.

Since the War, each country, instead of letting its economic organization assume the form most adapted to its natural and technical conditions and its geographical position, in accordance with the rational principles of the internat-

ional division of labour, has been preparing itself for exceptional times of crisis. Increasing numbers of "Isolated States" have appeared, uniform in their economic life and showing less and less cohesion between one another.

Between countries regulated in this way and to roughly the same extent, trade, and not less the wheat trade becomes much more difficult.

S. — *The future of Russian wheat exports.* — There can of course be no precise estimate as to what the future of Russian exports of wheat will be. Of one thing, however, there can be no doubt. The requisite agrarian and economic conditions for a further expansion of wheat production in the U. S. S. R. are largely in being. Although the area under wheat is now greater by a third than the pre-War area there remain large tracts of land which have not yet been brought under the plough. At present wheat production is extending from the areas of surplus output towards the north and east where its production is inadequate for the requirements of the areas. In future, therefore, these areas, which include the Volga area, South-West Siberia, the Omsk region and the Far-Eastern territories of the U. S. S. R. will be able to cover their needs with their own

from the U. S. S. R. in 1930-36.

output. Nevertheless, compared with the pre-War position the percentage area under wheat, and cereals in general, has fallen relatively; for the area under industrial crops such as cotton, sugarbeet, flax, etc., has been greatly extended.

There is also still room for a large increase in the yield of wheat per hectare, although in this respect there has been some improvement in recent years. The average yield for the years 1909-13 was 6.9 quintals per hectare, while by 1926-30 the figure had risen to 7.5, and in the year 1937 to 10.7 quintals per hectare. This figure is still, however, much below the yield per hectare obtained by the intensive agriculture of the importing countries. In 1937 Denmark, for example, harvested 28.5 quintals per hectare, Holland 27.3, Belgium 24.6, the United Kingdom 20.6, Switzerland 23.3, etc. In the overseas wheat producing countries too, the yield is somewhat greater than in Russia.

Much is being done in the U. S. S. R. to increase the yield of wheat; by a more efficient use of labour, by more extensive application of fertilizers, by measures against drought, especially in the trans-Volgan wheat area, by the improvement of the seed, and also by employing Lyssenko's method of vernalization for the pre-treatment of seed (*yarovizatsia*). By this method grain cereals are

made less dependent upon climatic conditions by speeding up the process of ripening. As a result, wheat can be successfully grown in northern parts.

The expansion of production, however, is only one aspect of the problem of the future of wheat exports. Other factors which must be considered are: the rate of increase of population in the U. S. S. R., the development of the internal market, and last but not least, the position of the international wheat market in the immediate future. At present these are all imponderables, which though referred to here are not open to scientific analysis.

### Export trade in flax.

The U. S. S. R. is also the largest producer of flax; indeed its importance as a producer of flax is much greater than as a producer of wheat.

Both climatic and soil conditions in the U. S. S. R. are suitable for the cultivation of flax. The most important areas for its cultivation are the Kalinin district, the Western Region, the districts of Yaroslav, Leningrad and Kirov, and the White Russian Republic. Together these areas account for about 75 per cent. of the fibre produced in the U. S. S. R.

In contrast to cotton, for example, the flax fibre must undergo a long and costly process for manufacture into yarn, for it must first be obtained from the stalk. A large supply of labour is therefore required, but the U. S. S. R. is favoured in this too, as there is no lack of labour.

The area under the long staple flax *Dolgunez*, which is grown mainly for its fibre, as contrasted with the *Coudrjache* which is cultivated almost exclusively for the seed, rose from 1,295,000 hectares before the War <sup>(1)</sup> to 2,510,000 hectares in 1932. In the last few years, however, the area under flax fell, amounting to 2,067,000 hectares in 1937 against a total area for the world in this year of 3,361,400 hectares.

In the last few years the average percentage share of land under flax in the total cultivated area of the U. S. S. R. was about 2 per cent.

As Table XVI shows, Russia's output of flax has experienced a large increase over the average of 3.3 million quintals for the years 1926-30, which represented about 59 per cent. of the world output; in 1938 5,500,000 quintals were produced, amounting to 75.03 per cent. of the world output.

After the U. S. S. R. come, though of very much less importance, Poland, Germany, Lithuania, Latvia, Belgium, France, the Netherlands, Czechoslovakia, Yugoslavia etc. All these countries together, however, only contributed a third of the total European output in 1937.

This shows Russia's importance as a flax producer for the European flax industry. Indeed, the U. S. S. R. has practically a monopoly of the flax market.

Flax is the fifth textile in importance on the world market, with a share in 1936 of 6.3 per cent. of all textiles, far below cotton with 53.7 per cent. Next in order of importance come wool (14.5 per cent.), jute (13.5 per cent.) and

---

(<sup>1</sup>) 3.3 million quintals in the territories at present constituting the U.S.S.R. — (<sup>2</sup>) Provisional figures.

hemp (6.9 per cent.). After flax in importance come rayon (3.9 per cent.), staple fibre (1.1 per cent.) and silk (0.3 per cent.).

It is interesting to note here that the agricultural product which first linked Russia with foreign markets was not cereals but flax. Exports of flax can be traced back to the year 1686, at the beginning of the reign of Peter the Great. In 1800 262 quintals were exported. By 1898 the figure had risen to 2.3 million quintals, by 1912 to 3.5 million quintals.

TABLE XVII. — *Russian Exports of Flax* (<sup>1</sup>).

1937 . . . . .	344,800	5,080,000	6.79	—	—

(<sup>1</sup>) International Yearbook of Agricultural Statistics, 1937, 1938.

As Table XVII shows, exports of long staple flax in absolute figures increased constantly from the end of the War to 1934, when they amounted to 913,000 quintals representing 17.1 per cent of the total Russian output and 36.4 per cent.

of world exports. Since 1934 exports have fallen off both relatively and absolutely. Thus average exports for the years 1926-30 were 19.4 per cent., or almost a fifth, of the U. S. S. R. output, while in 1937 they were only 6.8 per cent. or about a fifteenth. Further, before the War Russia's exports of flax amounted to almost three-quarters of world exports, while by 1936 this figure had fallen to 18.24 per cent., or somewhat less than a fifth.

In post-War years exports of flax from the U. S. S. R. have shown the same tendency as exports of wheat. Home production rose during the first and second Five Year Plans compared with that of the NEP period, and in some years even passed the pre-War figures, which related to the territories of the Russian Empire; but at the same time the percentage share of Russian exports relative to output has greatly declined.

This is due, as in the case of wheat exports, to the large increases in the employment of flax for the home industry. In 1937 the factory output of linen yarn reached 96,000 metric tons, compared with 39,500 metric tons in 1913 and 54,000 metric tons in 1932. In the same period the output of linen cloth rose from 119 million square metres in 1932 to 300 million square metres in 1937 <sup>(1)</sup>.

As a result of the large quantities of flax retained in the U. S. S. R. for home consumption, prices on the world market rose; for, as said before, Russian exports of flax have a decisive influence on world prices. Thus average prices per metric ton of Belgian and Latvian flax, c. i. f. in London in the years 1929-37 were as follows:—

TABLE XVIII. — *Average annual Prices of Belgian and Latvian Flax.*  
(Gold francs per quintal)

Year	Belgian water-retted	Livonian Z. K.
1929 . . . . .	336.12	187.05
1930 . . . . .	267.61	127.24
1931 . . . . .	243.72	80.83
1932 . . . . .	202.08	80.74
1933 . . . . .	172.91	86.71
1934 . . . . .	160.83	92.66
1935 . . . . .	159.81	117.07
1936 . . . . .	174.33	94.01
1937 . . . . .	193.40	117.87
1938 . . . . .	175.10	102.51

As a result of its superior quality the prices of Belgian water-retted flax are generally fairly high. In 1932, at the worst period of the depression and in the three following years, prices of both these types of flax fell to half their 1929 level. Since then a considerable rise in world prices has taken place, although in 1938

<sup>(1)</sup> *Le Journal de Moscou*, September 6, 1938.

they again fell some what. Compared with the prices of other textile fibres, prices of flax have remained fairly stable.

The reduction in the supply of Russian flax to the world market led to many countries expanding their own output of flax. Germany has shown the largest increase with a rise in the output of flax fibre from 31,000 quintals in 1933 to 339,000 quintals in 1937, thus expanding production more than tenfold in five years. Germany, like many other countries, such as Romania and Ireland, guaranteed fixed prices to flax producers. These prices are higher than those ruling on the world market, and the State grants bonuses to producers for increasing their output.

The output of flax in Belgium has also risen considerably, from 78,000 quintals in 1933 to 238,000 quintals in 1937. In France output rose from 92,000 quintals in 1933 to 243,000 quintals in 1936, but fell in 1937 to 190,000 quintals as a result of the reduction in the area under this crop. Production has also substantially increased in Italy and Poland.

The countries coming next to the U. S. S. R. as exporters of flax, though very much less important, are Belgium, Poland, Lithuania, the Netherlands, Latvia and Estonia. France and the Netherlands also export large quantities of flax straw to Belgium, where it is retted in the lower reaches of the river Lys and then worked up by the factories in the district of Courtrai.

In 1936 Russian exports of flax were distributed mainly between the following countries (in thousands of metric tons and in per cent.) <sup>(1)</sup>:

	1000 metric tons	per cent.
United Kingdom . . . . .	24.4	43
France . . . . .	16.6	30
Belgium . . . . .	9.9	18
Czechoslovakia . . . . .	2.4	4
Germany . . . . .	1.5	3
United States . . . . .	0.8	1
Sweden . . . . .	0.5	1
Other countries . . . . .	0.1	—
Total . . . . .	56.2 <sup>(a)</sup>	100

<sup>(a)</sup> This figure differs somewhat from that on p. 199.

The United Kingdom is the most important market for Russian flax, taking more than two-fifths of the total Russian exports. Next comes France with about a third and Belgium with about a fifth. These three countries together import more than 90 per cent. of the total exports of flax from the U.S.S.R. Czechoslovakia took 4 per cent., Germany 3 per cent., the United States and Sweden coming last each with 1 per cent.

The United Kingdom was the most important market before the War too, importing in 1912 for example 948,265 quintals, or almost a third of the total of 3,163,558 quintals exported. The British market has now become still more important.

<sup>(1)</sup> *Industrial Fibres*, Imperial Economic Committee. London 1938, p. 73.

In 1912 Germany took second place with a total importation of 816,730 quintals. Belgium came third with 722,870 quintals, then France with 367,250 quintals and Austria-Hungary fifth with 244,069 quintals.

France and Germany have therefore been the foreign markets which have most changed in importance in comparison with the pre-War period. Germany's position before the War as the largest importer of Russian flax has now been taken by France, who has risen from fourth place before the War to second now. At the same time Germany has fallen from second to fifth place.

Manufactured or semi-manufactured goods are now exported in large quantities from the U. S. S. R. In 1937 about 93,000 quintals of the total flax exports were exported in this form. The United States, which is the largest cotton exporting country in the world, is also the largest purchaser of linen goods, taking about 90 per cent. of total Russian exports. About 6 per cent. of the exports of the finished goods go to Sweden and Norway, about 2 per cent. to Iran, and smaller quantities to the United Kingdom and Lithuania.

### **Export trade in butter.**

Unlike exports of wheat and linen, the export trade in butter is a relatively new phenomenon. The exportation of Siberian butter in large quantities, whether abroad or to European Russia, began with the opening of the Trans-Siberian railway at the end of the last century. In 1894 65.5 quintals were exported, but by 1900 exports had already reached 163,800 quintals, whilst in 1913 exports were 790,000 quintals, amounting to 55 per cent. of the total production in Russia with a value of 71,558,000 gold roubles.

Of all Russian exports, butter came fourth in order of importance, being preceded only by wheat, barley and flax.

Before the War about a tenth of all butter exported from Siberia went to European Russia, the remaining 90 per cent. being sent abroad. Of the importing markets, the United Kingdom came first taking 48 per cent. of total Russian exports of butter, whilst Germany came second with 35 per cent. Denmark took 12 per cent., the remaining 5 per cent. being distributed between various other countries.

The War at first greatly reduced, and then completely paralysed butter exports. Only in 1923 were butter exports recommenced, this time through State and collective organizations. In this year about 40,950 quintals were exported to the United Kingdom and about 13,000 quintals to Germany. In 1924 exports to Germany rose steeply.

The butter for export is mainly supplied by the R. S. F. S. R., 88 per cent. of the total Soviet exports coming from this source. Within this Republic West Siberia supplies 41.6 per cent. of the total exports of butter from the U. S. S. R., the Northern territory 9.4 per cent. and Kasakstan 4.6 per cent. These areas are all rich in pasture and meadow land, and in them stockraising has for centuries been the leading form of agriculture.

The following table shows exports of butter from the U. S. S. R. in the last nine years compared with world exports of butter.

TABLE XIX. — *Exports of Butter from the U. S. S. R.*

(Metric tons)

Year	U. S. S. R. exports	Total exports of the most important exporting countries	Per cent.
1929 . . . . .	25,400	504,053	5.04
1930 . . . . .	10,522	529,631	1.99
1931 . . . . .	30,855	569,803	5.41
1932 . . . . .	30,934	544,439	5.68
1933 . . . . .	37,205	555,549	6.70
1934 . . . . .	37,903	588,417	6.44
1935 . . . . .	29,097	596,020	4.88
1936 . . . . .	23,177	595,641	3.89
1937 . . . . .	14,662	590,948	2.48

Although the U. S. S. R. <sup>(1)</sup> is the second largest producer of butter in the world, coming next to the United States, exports of butter have fallen both absolutely and relatively in comparison with world exports; in 1929 and 1933 the share in world exports was respectively 5.0 and 6.7 per cent., while in 1937 this figure had fallen to 2.5 per cent.

Compared with the volume of butter exported from the chief exporting countries of the world such as Denmark, who exported 152,911 metric tons in 1937, or such overseas countries as New Zealand and Australia, who come second and third respectively as world exporters of butter, Russian exports take a very modest place. As an exporter in Europe, the U. S. S. R. has taken either second place as was the case from 1932 to 1934, coming immediately after Denmark, though at a very considerable distance, or she has taken seventh place, as in 1937, coming after Denmark, the Netherlands, Ireland, Sweden, Latvia and Lithuania.

The percentage proportion of Russia's exports to her production of butter fell from 42.9 per cent. in 1932 to 12.4 per cent. in 1936.

The decrease in the cattle population from 1930 to 1934 as a result of the overthrow of the *Kolkhoz* movement was partly responsible for the reduced output of butter. In part, however, it was also due to increased consumption of butter within the Soviet Union.

In 1911 the per capita consumption of butter in Russia was  $\frac{1}{2}$  kg. and this figure fell to  $\frac{1}{7}$  in 1922, compared, for example, with a consumption of butter in the United Kingdom in 1913 of 8 kg. and in 1923 of 9 kg. per head; in France of 5 and 6 kg. respectively; in Germany of 5 and 4 kg. respectively; in the United States of 4 and 6 kg. respectively; and in Sweden of 6 and 8.5 kg. respectively.

By 1931 the per capita consumption of butter in the U. S. S. R. had risen to 3.5 kg. per head, while in 1935 the figure was 5 kg, or not much less, for example,

(1) There are no official statistics of the total U. S. S. R. output of butter.

than in France, where in the same year the figure was 5.7 kg, or in Sweden, where it was 5.9 kg.

The United Kingdom continued to be the principal export market for Russian butter after the War, taking 80 per cent. of the total exports of Russian butter in recent years. The United Kingdom is indeed by far the largest importer of butter in the world, and in 1937 took four-fifths of the total world imports. From Russia the United Kingdom imported 8,405 metric tons in 1930, the figure rising to 28,587 metric tons in 1933, but falling again in 1937 to 13,188 metric tons.

Germany came second, importing in 1930 3,135 metric tons and in 1932 13,288 metric tons. Since then these imports slowly fell off, to cease completely in 1937. The German butter quota system of 1932 led to a re-grouping of the countries exporting to Germany, and this led to a sharp fall in her imports from the U. S. S. R. Thus in 1932 the U. S. S. R. was the largest exporter of butter to Germany, while in 1933 she had fallen to sixth place.

In addition to these two markets, Italy took 3 per cent. of Russia's exports of butter in 1934. In recent years, however, these exports have entirely ceased.

In the last few years butter has also been exported to the United States, who in 1936 took 4.1 per cent. of Russia's exports of butter. Small quantities of butter have also gone to Mongolia, amounting to about 1 per cent. of Russian exports.

(The third and last section, to be given in a later issue, will deal with the wood and fur trades).

M. TCHERKINSKY.

## ECONOMIC AND CULTURAL CONSIDERATIONS ON THE FIBRE-AGAVES

### I. — The different hard fibre plants.

Since very early times Agave plants have been used in Mexico for the bleeding sap that flows from the centre of the plant after cutting the flower-stem. This sap is produced very abundantly over four or five months of the year, yielding up to a thousand litres of juice per plant. In Mexico this is converted by fermentation into alcoholic beverages, partly into a brandy called *pulque*, partly into a wine called *mescal*. Furthermore, in the countries of origin Agaves were used as a source of fibre; today, these countries are the biggest furnishers of hard fibres called "Sisal" or "Henequén". In addition to the Sisal plant (*Agave* sp.) the principal hard rope fibre plants now used are the Manila hemp (*Musa textilis*), the Coconut fibre (*Coir*, *Cocos nucifera*), the Mauritius hemp (*Fourcroya gigantea*), the Sansevieria fibre (*Sansevieria* sp.), the New Zealand hemp (*Phormium tenax*) and the little known Carob plant of Brazil (*Neoglaziovia variegata*). None of these plants was widely used until 1850, when in Yucatán (Mexico) the *raspador* (decorticator) was invented for the preparation of the Henequén fibre, and Manila hemp began to come into ever wider use, superseding the true hemp, i. e. the fibre derived from the stalks of *Cannabis sativa*.

<sup>(1)</sup> According to official statistics. More recent figures for Mexico were not available.<sup>(2)</sup> Long tons.

However, the cultivation of Manila hemp remained limited to the Philippines and there it was mainly confined to the "hemp provinces", which are in the southern parts of Luzon and in the Visayas Islands (Camarines, Albay and Leyte). Attempts to extend the cultivation of Musas elsewhere failed owing to the special requirements of this plant as regards climate and soil. In south Sumatra (Lampung) two plantations exist, but their output has not for some years exceeded 200 to 300 metric tons. Nevertheless, the export of Manila hemp rose steadily, reaching 90,000 metric tons in 1900, passing the 100,000 tons mark in 1906, and reaching a peak of nearly 190,000 tons in 1935. But Manila hemp has also found competitors in Sisal hemp and, to a much smaller extent, in the Mauritius and New Zealand hems. The Sisal, a plant originating from the semi-arid regions of South and Central America, especially Mexico (Yucatán), grows fairly well throughout the tropics and subtropics on soils where other plants such as coffee, tea and rubber could not yield sufficient crops.

In the last few years, the hard fibre plants have attracted special attention on account of the disappearance from the European market of some of the soft fibres. Since 1932 the export of flax from the U. S. S. R. has ceased. The policy of the Italian Government in regard to Italian hemp results in home-produced fibres being held back from the open market. The *Federcanapa* maintains prices at a level considerably above those at which other competing fibres are being sold, with the result that the export trade has been on a very limited scale except to Germany, which country is said to have purchased about 30,000 metric tons on the barter system. On account of this scarcity of supplies in the soft fibre market great efforts have been made to replace these fibres by hard fibres, of which the spinning process has been greatly improved. Nowadays one finds Sisal used in the production of yarns, lines, carpets and mats and other products for which formerly hemp alone was used.

## II. — Production and trade of hard fibres.

From Table I we see how, owing to its adaptability to climate and soil, Sisal cultivation has now spread over the hot countries of the whole world. In addition to the countries named in the Table we find some production also in the Mediterranean countries, which, however, is only for local consumption.

Furthermore, we see from Table I that:

1. Manila hemp, also known as *Abacá*, is no longer the principal hard fibre produced. In the last two years Sisal fibre production has passed that of Manila hemp and is now more than twice as great.

2. The total output of hard fibres is fairly well distributed between the different nations:

U. S. A. territories . . . . .	181,500 metric tons or 33 %
British » . . . . .	151,000 » » » 28 %
Dutch » . . . . .	86,600 » » » 16 %
Mexican » . . . . .	93,500 » » » 17 %
French » . . . . .	6,000 » » » 1 %
Portuguese » . . . . .	26,000 » » » 5 %

3. The three most important producers of Sisal, namely the Dutch East Indies, Tanganyika and Mexico contribute nearly equal shares to the world output of Agave fibres.

As regards the trade in hard fibres, Table I shows that in 1937 and 1938 the total exports underwent the following fluctuations. In 1937 the exports of Sisal rose by about 35,000 tons above the 1936 figure, whilst the exports of Manila and other hemps hardly showed any change. In 1938, however, the former showed a decrease of about 24,000 tons and the latter of about 23,000 tons on their 1937 figures. Therefore the total exports of hard fibre, which in 1937 had risen by about 35,000 tons as against 1936, in 1938 fell by about 47,000 tons as against 1937.

Table II shows the destinations of the exports from the producing countries. Except in the case of Mexico, of which the United States absorb nearly 80 per cent. of the exports and Belgium and Holland as the main countries of entrepôt trade for hard fibres take the remainder, the exports from the Dutch East Indies and from East Africa are fairly well distributed over the whole world, so that all countries with mercantile or fishing fleets have their needs satisfied.

There are now some eight countries absorbing the bulk of the exports. Of these the United States of America are by far the largest with 170,000 metric tons; next comes Great Britain with 82,000 tons, followed by Japan with 67,000 tons, Belgium with 63,000 tons, Holland with 28,000 tons, Germany with 27,000 tons and France and Canada with 10,000 tons each. Belgium, however, serves mainly as a country for entrepôt trade, importing according to her own statistics (1937) only 35,395 and 6,947 metric tons of Sisal and Abacá respectively, of which 16,165 tons of Sisal were re-exported, mainly to France, Germany and Russia, as raw fibre.

### III. — Utilization of hard fibres.

The utilization of hard fibres varies according to the different countries.

In the *United States of America* and *Canada*, Henequén is used more than any other fibre in the manufacture of binder twine (600 to 650 feet per pound) for harvesting grain. There was an ever increasing demand for this purpose from 1888 to 1916 when wheat prices, like nearly all prices, were rising. Since then there have been periods of over-production and also periods of scarcity. However, the increasing use of the "combine" (combined harvesting and threshing machine), is reducing the demand for binder twine. Moreover, the rapidly increasing production of Sisal has resulted in serious competition for Henequén. Now both fibres, alone or mixed together with or without Abacá, are also used for hammocks, general purpose ropes, halter ropes and to some extent for marine cordage. Finally in the *United States* we find Sisal used in combination with cotton for the manufacture of coarse canvas and of sacks.

In the *United Kingdom*, the next largest consumer, the depression of the Sisal industry in 1930-31 led to an examination of the possibilities of developing new industrial uses for Sisal fibre. In other countries such as Holland efforts

have been made to use Sisal as a substitute for Jute and to break its monopoly in sack manufacture. But such a policy would not be appropriate for Britain, as Jute is also an Empire-grown fibre plant. Therefore the Imperial Institute of London has made efforts to find other uses for Sisal and to diminish reliance on Manila hemp, which is not much grown within the Empire. For this reason the Admiralty was induced to undertake experiments in order to overcome the prejudice against the use of Sisal for marine cordage.

These experiments have given good results, and the tests covered a wide range as over 100 ships and other users participated in them. Incidentally, a good many complaints arose, but only four instances of actual parting of the cordage during use were reported. The following defects can, however, be definitely regarded as peculiar to marine cordage made exclusively from Sisal:

(1) It shrinks in length when wet and requires continual care in wet weather.

(2) It swells when wet.

(3) It elongates considerably under load, particularly when wet, and in some cases becomes definitely long jawed. Under some conditions it tends to return to size after the load is removed, but generally the extension is more or less permanent.

(4) It becomes greasy and slippery and is difficult to handle when wet, and greater care is necessary when working it round a cleat or bollard.

(5) After prolonged use it tends to chafe and fray and becomes discoloured.

On account of these results, the Admiralty has made the following recommendations:

"In considering the results of the trials, the question of Sisal being an Empire product must be given prominence. If the two fibres, Sisal and Manila, were on equal footing as regards their origin, the results would not warrant any departure from the existing practice. As, however, the policy of the Admiralty is to give a preference to Empire products the results are sufficiently promising to warrant the partial adoption [of Sisal, and (so long as supplies of Sisal can be obtained at satisfactory prices) arrangements are being made for 50 per cent. of the Service requirements for towing hawsers, heaving and hauling lines to be made from Sisal, as also for its entire adoption in the manufacture of much other cordage of minor importance in navigation".

Again in 1933-34, the Admiralty made experiments in order to ascertain the capacity of Sisal to absorb tar and to test whether cordage so treated would have its weather-resisting properties increased. To carry out the tests, four 120-fathom coils of 3-inch cordage were manufactured. All the yarn used for this purpose was from the same delivery of No. 1 East-African Sisal. Two of these coils were tarred and two untarred. The two tarred coils were prepared in the usual manner, i. e. the yarn was passed through a bath containing Archangel tar. The quantity absorbed by the fibre was 12.87 per cent. of the weight of the finished coil. During the process of manufacture a batching compound was used, about 4.5 per cent. being used for dressing the fibre which was subsequently tarred, and 12.5 per cent. for the untarred fibre.

The initial strength of the untarred yarn before manufacture into cordage was 175.4 and of the tarred 163.6 lb. Strands removed from the cordage at the end of the nine months' test period gave the following results (average of ten tests):

	Sea exposed	Roof exposed	Storage conditions
Untarred . . . . .	72.0	95.0	161.0
Tarred . . . . .	132.5	139.5	150.5

The Admiralty considered the results of these tests sufficiently satisfactory to warrant consideration of the general adoption of tarred Sisal cordage in lieu of tarred hemp cordage, and enquiries are now being made as to the extent to which such substitution can be effected.

In *Japan*, the third largest consumer, importing some 70,000 tons of hard fibre, this commodity is used principally for marine cordage, but also for many other products such as coarse canvas, mats, blinds and brushes. In Japan too Sisal has been largely used for the manufacture of braids used in the ladies' hat industry. Small factories for this purpose have sprung up in Japan due to the encouragement and activities of the Home Industrial Association of Japan, and the braids made are shipped to all parts of the world. The use of Sisal for the manufacture of shoe tops is also recorded in Japan.

In *Belgium* such of the import as was not re-exported as raw fibre was absorbed by the large textile industry and mixed with the waste of other fibres. In 1937 13,702 metric tons of mixed fibres were manufactured into ropes, cables and lines and exported to Norway, France and England; 8,531 metric tons were used in the production of coarse yarns, half of them exported to France; and the remainder were used for mats and carpets.

In *Germany*, the bulk of the imported hard fibre (mostly Sisal) is used for marine cordage, the German navy having been equipped exclusively with Sisal ropes during the Great War. The rest is manufactured into binder twine, general purpose lines and strong coarse threads.

Of the other importing countries, *Holland* chiefly deserves mention on account of the investigations being made in the mother country and the colonies into the manufacture of sacks out of Sisal fibres. However, this plan is by no means new. In 1933 it was reported that some 50,000 sugar sacks were on the way to, or had been landed at Liverpool, and that there were some 3,000,000 sacks in Mexico to be used for packing produce for shipment. These sacks were manufactured under Government instruction in order to restrict the import of Jute. Also in Colombia, a local industry for the manufacture of sacks has grown up amongst the native population; and during the War, in 1918, it was recorded that Bucaramanga exported over 1,000,000 sacks, and another town exported over 200,000, representing 1,200 tons of fibre. In 1932, the Government of the Dutch East Indies ordered that experiments be begun in the manufacture of bags from Sisal fibre by prison labour. This has been started especially on the island

of Madura where many wild or semi-cultivated Agaves grow, and where the State salt monopoly requires some hundreds of thousands of coarse bags each year. Owing to the cheap prison labour the yarn is spun by hand and only industrially woven on looms in the prison of Pamekasan. The production was as follows:

1934 . . . . .	150,000 large bags
1935 . . . . .	210,000 " " and 6,000 small bags
1936 . . . . .	300,000 " " " 8,000 " "

The large bags measure 107.5 cm. by 75 cm. and the small ones 60 cm. by 75 cm.

In the year 1933 the *Handel Vereeniging Amsterdam* reported the installation of an experimental factory equipped with modern English plant for the manufacture of bags in Java.

But in Rotterdam already as early as 1927 a Sisal rope factory tried to introduce the manufacture of bags, and it is said to have exported Sisal bags to America. Also this factory has begun to deliver sacks to the dealers in coal for domestic uses, the bags being superior for this purpose to the Jute bags formerly used.

On the strength of these efforts to look for a market for the hard fibres, the Trade Museum of the Colonial Institute of Amsterdam induced some importers to initiate experiments with Sisal bags in the overseas trade in colonial commodities. Accordingly small lots of pepper, copra, cocoa and nutmegs were shipped from the Dutch East Indies to Rotterdam and small lots of coffee and oil-palm kernels from the Congo to Antwerp.

The bags had an average size of 105 by 70 centimetres and an average weight of one kilogramme, corresponding to a weight of 680 grammes per square metre. Jute bags from Bengal showed the following figures:

A twills 110 × 65 cm. 1.19 kg. = 830 gr. per sq. m.

Light C 100 × 70 cm. 0.91 kg. = 650 gr. per sq. m.

Thus, as regards weight, the Sisal bag did not compare unfavourably with the Jute bag. However, it was anticipated that the Sisal bag, being less smooth and flexible, might be harmful to the content.

With regard to pepper, this harmful effect proved to be negligible, and the opinion of the consignee was completely favourable.

In the case of cocoa, a commodity of superior quality, the Sisal bag was considered to behave less favourably. The bags were too badly and loosely woven, and the slight damages so easily done to the bag by handling in transport and by taking samples, could only be repaired with difficulty owing to the lack of smoothness of the tissue. Threads drawn through for repairs opened the tissue next to the damaged part, so that the repairing caused more harm than did the original damage.

The same opinion was passed as regards the transport of nutmegs in Sisal bags.

In the case of shipments of copra in Sisal bags, the opinion of the consignees was altogether favourable. These experiments resulted in the Association for the Copra Trade allowing the use of Sisal bags as well as of Jute bags in the

standard contracts. However, the consignee is permitted to deduct 4 Dutch cents per bag owing to the lower value Sisal bags have in the trade in old bags.

The small Sisal bags delivered by the Dutch factory for the transport of ores from the Congo found a ready acceptance.

On the other hand, those delivered to the tin mines in the Dutch East Indies were rejected on account of the lack of density of the tissue, which resulted in the ground tin leaking out. However, in the same country the shipment of unground manganese was permitted and the use of Sisal bags met with no objection.

To summarise, the Amsterdam Museum of Trade concludes that:—

*a.* The Sisal bag does not present any difficulties in the shipping of pepper, nutmegs of inferior quality, coffee, copra, oil-palm kernels and loose salt, but it is unsuitable for the transport of cocoa. The Sisal bag also is unsuitable for ground tin and ground manganese, but may well be used for unground ores.

*b.* The difficulties in the use of Sisal bags are mostly due to the lack of smoothness of the tissue, making it nearly impossible to repair the damages occasionally done in handling and in the taking of samples. In any case Sisal bags are less easily repaired than Jute bags.

*c.* The Sisal bag is used frequently in the shipment of coffee from Central America.

#### IV. — Prices of Sisal.

After these remarks on the uses of Sisal the next consideration is that of prices, especially in relation to the prices of the competing commodities.

The use of Sisal in the manufacture of sacks cannot bring much relief to the Sisal market. For this purpose use can generally only be made of tow and inferior qualities of fibre, especially of Cantala owing to its better flexibility. For the producer, the pivot price of Sisal lies near £ 15 per long ton, this being the average total cost price in the main producing countries (see part VI). During recent months the London price of No. 1. quality has again approached this pivot, thus facilitating the use of Sisal for different purposes. However, in times of better prices the competition which Sisal has to meet depends largely on the prices of other commodities serving more or less the same requirements. The yearly average prices in London of commodities competing with Sisal during 1933 to 1937 are set forth in the following table taken from the International Year-book of Agricultural Statistics, 1937-1938.

	1933 L.s.d.	1934 L.s.d.	1935 L.s.d.	1936 L.s.d.	1937 L.s.d.
Jute "First marks" . . . .	15. 13. 2	15. 9. 9	18. 11. 8	18. 6. 8	20. 8. 9
Manila Hemp "J. 2" grade . .	15. 18. 2	14. 17. 8	19. 4. 3	28. 1. 1	33. 16. 10
Sisal No. 1 East African . . .	16. 8. 7	15. 9. 5	19. 7. 11	27. 9. 2	27. 4. 8

According to this table, the prices of Sisal and Manila have followed a more or less equal course, but the competition of these two with Jute in the years 1936 and 1937 must have raised difficult problems for spinners, even if it is taken into account that tow and waste of hard fibres generally cost £ 3-4 less than No. 1 quality.

In Europe only the use of the most modern spinning methods may possibly allow competition between Jute and Agave fibre and their mutual substitution, as the latter cannot be spun as fine as Jute. Therefore, for the same surface of twill, the quantity of Sisal fibre required considerably exceeds that of Jute and so makes competition impossible. Hence also, the substitution of the cheap Caroà fibre of Brazil is handicapped owing to the smaller experience of spinning in that country and to the less modern plant used.

*Trend of Prices c. i. f. London.*

In consequence of these limited possibilities of sale, the prices of Sisal fluctuate very much. As can be seen from the graph, years of high, profitable prices alternate with years of very low, unremunerative prices, and it is difficult to find adequate reasons for these fluctuations. Therefore it can only too easily be understood that Sisal planters look for uniform restrictions on production and speak of agreements to be made as regards selling prices. In September 1934 a meeting was held in London, wherein participated representatives of the main producing territories, i. e. the Dutch East Indies, East Africa, Mexico, the Philippines and New Zealand which agreed "in principle" to the adjustment of the outputs of the territories to world consumption. This meeting - perhaps indeed as a result of it - was followed by a general rise of prices of hard fibres. Since then, however, nothing further has been done to apply this remedy of "adjustment of prices", nowadays so very popular in the trade of most other commodities.

In the case of Sisal one must be very doubtful as to the success of any such agreement, as it would be very difficult to gather the many producers together into one scheme. For instance, some countries such as Mexico, have a definite market assured them by their geographical situation, whilst other producers, e. g. of Cantala, are assured of a market by a certain standardisation of their product. Last, but not least, in the Dutch East Indies, some 50-60,000 tons are controlled by one large and powerful company which is in general opposed to agreements with weaker companies.

## V. — Different cultivated agaves and the characteristics of their fibres.

The literature on Agaves contains many incorrect statements regarding the classification of species, owing to the fact that many botanists have only studied dry herbarium species or green-house cultivated plants. The different species are adapted to certain conditions of soil and climate, and they also vary in size, quality of fibre, length of life and other important economic characteristics. It is therefore well to classify the plants.

The following eleven species are the principal ones, three of them only being at present of commercial value, but the others may become of more importance as a result of the researches on new fibre Agaves being carried out in the Amani (Tanganyika) Experimental Station.

The three most important species of commercial value are:

(1) *Agave fourcroydes*. Lemaire.

Henequén (pron: Hen-e-ken), Spanish name.

Sacci (pron: ssak-ki), Maya-Indian name.

Botanical synonyms: *A. rigida elongata*, *A. elongata*, *A. ixtle*, *A. rigida longifolia*.

Native in Yucatán (Mexico) and cultivated there. It constitutes more than 90 per cent. of the fibre of commerce. The plant is propagated from suckers, bulbils or seed. Suckers are used in practice. It develops a trunk and the leaves thereon are 1 to 2 m. long and always glaucous (grey-blue). Marginal spines always present, curved with points downward. The flower-stalk is 4 to 8 m. high with rather stout horizontal branches, forming seedpods.

(2) *Agave sisalana*. Perrine.

Sisal (Original Spanish name of port of shipment).

Yaxci (pron: jash-ki), Maya-Indian name.

Botanical synonym: *A. rigida sisalana*.

Native of Central America, not cultivated for fibre in Yucatán. Commercially cultivated in the Bahamas, Turks and Caicos Islands, Hawai, Java, Tanganyika, Kenya and Uganda, Bengal, Indo-China and Congo. It is mostly propagated by suckers. The leaves are dark green or slightly glaucous and 1 to 1.75 m. long. Usually no marginal spines but occasionally small spines pointing downwards. The flower-stalk is 4 to 8 m. high with slender branches projecting upward. It will endure a wider range of conditions of growth than Henequén. Seedpods only on cut poles.

- (3) *Agave cantala*. Roxburgh.  
*Nanas sabrang* (Java).  
 Manila Maguey (Philippines).

Synonyms: *A. cantala*, *A. vivipara*, *A. rigida elongata*, *A. elongata*. Was introduced into the Philippines, India and probably Java in early Spanish times and not known in native wild condition in America; mainly cultivated in Java and the Philippines. The plant is propagated from suckers or bulbils; seed pods are not reported. The leaves are glaucous and 1.50 to 2 m. long. The marginal spines are hooked or curved pointing upwards. The flower-stalks are 4 to 7 m. high and slender. *Cantala* grows well on loam soil and endures moisture better than either *Sisal* or *Henequén*.

The Fibre-Agaves of minor importance are the following species:—

PLANT	FIBRE	LOCALITY OF PRODUCTION
<i>Agave tequilana</i> Trelease	<i>Tequila</i>	Jalisco
<i>A. zapufo</i>	<i>Zapufo fina</i>	Vera Cruz, Tamaulipas
<i>A. Lespinassei</i> Trelease	<i>Zapufo fuerte</i>	" " "
<i>A. Deweyana</i> Trelease	<i>Zapufo larga</i>	" " "
<i>A. lophanta</i> Schiede (= <i>Leguilla</i> Torr.)	<i>Tula ixtle</i> (Tamico)	Mexico
<i>A. falcata</i> Engelm.	<i>Guapilla</i>	
<i>A. striata</i>	<i>Espadinin</i>	
<i>A. cocui</i> Trelease	<i>Dispofo</i>	Venezuela

All *Agave* fibres are produced by the leaves, the stem is mostly contracted and also if developed does not yield fibres. In the *Agave* leaves three main zones of fibres can be delimited:—

(a) A peripheral zone, composed of one or more rather irregular rows of small fibres. These are of nearly circular cross section.

(b) A median line of large fibres. These are horseshoe-shaped in cross-section, containing a conducting strand in the open side of the crescent, and a smaller fibre opposite to the xylem of the strand.

(c) Fibres in the ground-tissue of the leaf. These form a series between the fibre-types of zones *a* and *b*.

*Agave* fibres fall into three types, all fairly well defined:—

(1) "*Mechanical*" fibres. — These are most strongly developed round the periphery of the leaf, though they also occur scattered through the leaf parenchyma. They vary in length from a few centimetres to almost the length of the leaf. These fibres are of great importance commercially, as, owing to their shape, they seldom divide during the process of manufacture. The "fineness" of a fibre sample therefore depends, from a commercial standpoint, almost entirely on the fineness of these fibres.

(2) "*Ribbon*" fibres. — These invariably occur in association with the conducting tissues. They run from base to tip, and if the fibres of a leaf are classified on the basis of length, the longest classes are entirely composed of these fibres. They are also important in that they readily split longitudinally, and in this way form a contrast to the mechanical fibres. The fineness of commercial fibres, therefore, is not dependent upon the original size of these fibres.

(3) "*Xylem*" fibres. — These fibres are of no commercial value as they are thin-walled, and invariably broken up and lost during the process of decortication of the leaf.

Generally speaking, no important differences exist between *Henequén* and *Sisal* fibres, such as do exist between *Sisal* and *Cantala*. Furthermore, these differences are only to be distinguished microscopically and are not always reliable.

The ash of Agave fibres fairly regularly contains prismatic pseudocrystals of calcium, originating from the oxalate of lime of the Agave leaves. These pseudocrystals are changed into needles of sulphate of lime by addition of sulphuric acid. On account of these incrustations of the ash, fibres of Agave may easily be distinguished from the Manila hemp fibres. Its ash contains only stegmata which remain after the treatment of the fibre with chromic acid. The stegmata are amorphous substances of silicium.

Agave-plants require a tropical climate. There are no commercial Agave-plantations outside the tropics. While the plants often survive temperatures of 2 to 15° C. below freezing point, they are sometimes also injured by cold even above freezing point. Henequén plantations have been worked almost under the Tropic of Cancer near Victoria, Tamaulipas, where light frosts occur nearly every winter. The bulbils and tips of the leaves are sometimes injured by the cold weather. But such damage is also reported from East Africa within the area of the tropics, where the Sisal is injured by heavy fogs during the early morning.

The average annual rainfall in the Henequén-growing areas of Yucatán is about 30 inches (750 mm), and the lowest recorded temperature is 10° C., but it is usually very dry in winter. The climate is arid, with an abundance of bright sunshine. In Java, Sisal grows in well drained soils with an average annual rainfall of more than 100 inches (2,500 mm).

Rains and fogs interfere with the drying of the fibre.

## VI. — Producing countries of hard fibres and their methods of cultivation.

### East Africa.

East Africa has become a most important producer of hard fibre so that it now stands level with the Philippines. Tanganyika Territory contributes the biggest share of Sisal fibres to the East African output, its export of this commodity indeed considerably exceeding that of such other products as coffee, cotton and gold. The percentage of Sisal exports by value in relation to the total exports of Tanganyika was as follows:—

1933 . . . . .	34.7 %
1934 . . . . .	32.0 %
1935 . . . . .	32.9 %
1936 . . . . .	41.5 %
1937 . . . . .	41.8 %

The value of the next most important products exported, such as cotton, coffee and gold amounted in 1937 only to 12.1, 10.6 and 8.6 per cent. respectively.

The principal export harbours from Tanganyika Territory are Tanga and Dar-es-Salaam, which together take more than 70 per cent. The export harbour for Kenya is Mombasa.

The past year has proved most disappointing to Sisal producers, quotations moving for the most part within narrow margins resulting in an average price of about £ 17. 5s. for No. I grade. This figure is quite unremunerative to planters, giving them little encouragement to develop their estates any further. Hopes were raised of substantial sales of fibre resulting from the record sowings of wheat and reports of favourable weather prospects for grain crops throughout

the world. Therefore some disappointment was caused when binder twine prices for the season were fixed in America at one half cent per lb. below those of the previous year. During April the larger-scale buying on the part of Continental consumers caused a sharp upward movement, but this eventually slowed down owing to the fact that American spinners continued a cautious buying policy. One favorable feature is that most of the estates are well sold in advance, while stocks are low both in Africa and in Europe. The production of Africa has exceeded expectations, exports from Tanganyika again showing an increase of about 10,000 tons over last year, whilst the Kenya production is approximately the same as in 1937. Meanwhile, under the influence of constantly low prices, much work that is necessary to keep estates in good order is being postponed, pending a return to a profitable price level.

Adversity has prompted the African Sisal industry to introduce measures aiming at closer co-operation between Africa and London, as a result of which the Sisal Growers' Association has been constituted in London to represent the Growers' Associations of Tanganyika and Kenya and to look after Sisal interests generally. Further measures are in contemplation which, it is hoped, will eventually bring stability to the trade with a view to maintaining such conditions as will yield a fair return to producers.

Working in conjunction with this movement the Merchants' and Brokers' Section has been reorganised under the aegis of the London Chamber of Commerce, this section dealing with matters concerning quality, grading, packing, claims and contract conditions.

An unexpected step has recently been taken by the Tanganyika Government in promoting a bill entitled "The Sisal Industry Ordinance", the object of which is to provide for the registration of Sisal plantation and estate marks, to supervise the grading and packing of Sisal, and to take other measures for the promotion and protection of the industry.

Sisal tow values have kept fairly steady and the production has found a steady market, a large proportion being used for bag manufacture and also for bedding and upholstery purposes.

In East Africa two large centres of Sisal planting exist: Tanganyika and Kenya. The former extends mostly in the triangle between Tanga, Pangani and Korogwe, in the hot lowlands near sea level; the latter has its greatest concentration within fifty miles towards the north and east of Nairobi, at an altitude of some 1,500 to 2,000 metres above sea level. Here Sisal is planted in areas with an average rainfall of 600 to 700 mm. The highlands enjoy a cool climate during most months of the year, whereas the climate of the coastal belt of Tanganyika, where most of the Sisal of that territory is grown, is hot. The rainfall varies from 1,000 to 1,500 mm. yearly, in both centres fairly well distributed over the whole year, the main rains falling during April and May, the short ones during November.

In consequence of the cool climate the growth of Sisal in Kenya is prolonged in comparison with Tanganyika to nine years, and cutting cannot begin until the fourth year from planting, or a year later than in the warmer regions of Tanganyika.

In Kenya the soils are mostly red earths, laterized, or black or grey clay, whilst in Tanganyika sands overlying coral limestone prevail.

In Kenya the initial clearing of land for Sisal plantations is fairly easy on account of the original bush being sparse. The cost of bringing new areas into bearing in the fourth year of growth with the aid of diesel-engined tractors is between 150 and 180 sh. per hectare, while the replanting of old areas is about 30sh. cheaper. Methods in Kenya must of necessity be more thorough, and their results show that Sisal responds to superior cultivation. In the coastal plains of Tanganyika, where moisture is plentiful, weed control is the main problem.

Local conditions have determined the nature of planting methods in both instances. The cultivation of land for Sisal in Kenya is facilitated by using diesel-tractors, and elaborate though this method may seem, and longer though it takes to reach the cutting stage, it is no more costly than the primitive methods used for starting a Sisal plantation in Tanganyika by hand labour only.

In Tanganyika spacing is largely determined by the simple relationship between density of plants and yields. The number of plants is seldom below 4,000 per hectare and is commonly 5,000 or more, which is possible under a heavier rainfall. In Kenya the question of spacing is more involved, generally 2,250 to 3,360 plants per hectare being planted. However, these spacings have since been thought too generous, and the trend is now towards closer spacing in the row and wider distances between the rows.

In Kenya fibre yields are usually reckoned in long tons per acre per cycle instead of per hectare per annum as in Tanganyika. Five or six cuts are made per cycle, giving an average of 228 leaves from each plant during its life and yielding a total of about three long tons of fibre per acre. This is equivalent to nearly 1,500 kilogrammes per hectare per annum, which falls short by about half a ton, or occasionally much more, of yields obtained from newly planted areas in Tanganyika, which, however, may decline to the Kenya figure after regeneration by sucker selection. It is interesting that Kenya yields should compare so well, and they do so largely because Kenya leaves are of superior length and weight. Results show that short, spare leaf spells a rise in production costs.

It is indeed difficult to obtain reliable figures for yields per hectare of bearing area. Statistics are generally based on the weight per leaf, and all writers agree that the dry fibre content of the leaves is between 3 and 4 per cent.

Also as regards the cost price of the big plantations, very few reliable figures are available. Therefore it is of especial interest to find some returns in the "Times" (London) of July 28, 1936 given by Messrs. Sisal Estates Ltd. in their prospectus of that date. The Manager estimates that the long ton is produced at the following cost price:

	£	s.	d.
c. i. f. (London) costs, incl. selling expenses . . .	10	17	6
Provision for amortisation of growing crops . . .	2	0	0
Provision for depreciation of plant and machinery	1	10	0
Provision for contingencies . . . . .	0	7	6
London office expenses . . . . .	0	10	0
Total cost . . .	15	5	0

This may be the pivot price above which the profits begin, as is also seen from other sources.

Pests and plagues are not very often reported from East Africa. In the Tanga province (Tanganyika) only a weevil *Scyphophorus acupunctatus* Gyll. does much damage. It appears to have been introduced together with its host plant from its original home in Central America. It attacks young plants, weak plants and plants which have flowered. Its main breeding ground is the plant base subsequent to inflorescence ("poling").

Furthermore, it is reported that Sisal suffers from lack of potassium in different regions of East Africa. This point is discussed also in the section regarding the Dutch East Indies.

### Dutch East Indies.

In this territory the production of hard fibres is not as important a part of the total output of agricultural products as in East Africa. In 1937, for example, the value of exported fibres amounted only to hfl. 14,897,255 (£ 1,655,250) or 2.3 per cent. out of a total export of agricultural products valued at hfl. 660,000,000 (£ 73,000,000).

The official statistics of area planted and production per province are incomplete, owing to the fact that big concerns, particularly the *Handels Vereeniging Amsterdam*, do not publish figures concerning yields and areas.

In Java there are eleven estates, all in the Surakarta Government which produce Cantala fibre only. In 1937 the area amounted to 6,374 hectares of which 4,816 hectares were in production. The total yield of Cantala was 4,588 metric tons of dry fibres. Quality has shown a high standard, being better than the "Maguay" of the Philippines. Although it has been possible to reduce working costs by exercising the utmost economy, it cannot be regarded as a profitable industry with the prices prevailing in 1938.

The Cantala market is a very restricted one, the demand being much smaller than that for Sisal fibre. Also, the Cantala plant is much more liable than Sisal to certain diseases which result in a reddened fibre. On account of its spiny nature it is also slightly more expensive to harvest, and therefore on big estates its growth has been more or less abandoned.

The methods of cultivation on one of the biggest estates of Java are the following. The suckers, or bulbils, or both, as they case may be, are planted in nursery beds, where they remain one year. They are then transplanted to the fields. The fields are divided into blocks, 12 metres (39  $\frac{1}{3}$  feet) wide and of the length of the field. Each block is bounded on either side by a drain about 50 centimetres in width and 60 centimetres deep, these drains leading to a main drain running along the side of each field. The plants from the nursery beds are set out in rows according to either of the methods illustrated in the diagram on the next page.

Method I was formerly almost exclusively used, but is now being replaced by method II, which facilitates cultivation around each plant, particularly after the plantation is one year old.

Harvesting of the ripe leaves commences when the plantation is about fourteen months old, and continues for about seven years. Two crops of leaves are obtained each year, the yield being 3 to 5 tons of fibre per hectare per annum.

Each year potassic and phosphatic fertilizers are applied at the rate of about 150 kilogrammes of potash ( $K_2O$ ) and 100 kilogrammes of phosphate ( $P_2O_5$ ) per hectare for Sisal, and the same amount of phosphate and half the amount of potash for Cantala, which is found to

Diagramme II.

possess about half the potash requirements of Sisal. Of course the quantity of each fertilizer applied must vary according to the type of soil in which the plants are growing.

After cutting the leaves are graded in the field according to length.

Leaves above one metre in length are placed in grade A.

Leaves between 75 centimetres and one metre are placed in grade B.

Leaves of between 50 and 75 centimetres are placed in grade C.

Broken and diseased leaves are graded X, Y, and Z instead of A, B and C according to length, those above 1 metre in length being placed in grade X, those between 75 centimetres and 1 metre in grade Y, and those between 50 and 75 centimetres in grade Z.

The Anglo-Dutch Plantations Co. Ltd. of Java reports that their fibre is produced at a cost of about £ 10. 15sh. per ton loaded on the ship. This includes field, factory and transportation costs, to which must be added depreciation and overhead costs. The factory costs are about £ 2. 10sh. per ton so that field and transportation costs must approximately amount to £ 8. 5sh. per ton. The total cost of production will be nearly the same as in East Africa.

In the Lowlands of Java on soils previously used for rice planting, a decided lack of potassium prevails, which gives rise to a peculiar under-development. This lack can be made good by planting green manure-plants, especially the deep rooting *Tephrosia candida*, which is worked under. But this does not work satisfactorily in the long run. Therefore, it is absolutely indispensable to give an adequate treatment with potassium, in order to avoid the typical appearances of disease caused by lack of potassium, and known also in other countries.

It can be seen from experience that in Java the cultivation of Agaves does not pay on estates where cheap transportation of the leaves is not possible. It is also not profitable on estates where, owing to poor soils or cool climate,

the production is less than 3,000 kilogrammes of dry fibre per hectare. It may be profitable on soils with little humus where humus-requiring plants, such as coffee, are not growing, providing these soils are naturally well drained and not more than 400 metres above sea level.

The cultivation of Agaves is most profitable in conjunction with the cultivation of other crops. Then it is not necessary to depend on Agaves alone or to cut more leaves than may be suitable for the best development of the plants in times of low prices. Estates suitable for a large central factory, permitting easy transport of leaves by rail from all parts of the plantation are preferable. It is not profitable to run estates of an area less than 500 hectares owing to the costly plant needed for the extraction of the fibres.

### Mexico.

From the Henequén industry of Mexico only meagre information is available, so that it is difficult to judge the situation. Official reports concerning prices, output, shipments, stocks and sales effected are withheld, but from unofficial quarters it appears that the receipts in Progreso coincide very closely with shipments. Whether and to what extents stocks are accumulating inland is not apparent. A bulk sale of 150,000 bales was reported in March 1938, and as shipments go on, it is obvious that large-scale purchases must have been concluded on terms which have not been published. Shipments to U. S. A. ports account for about four-fifths of the quantity exported.

Conferences were held during the past year between the Henequén producers and the American twine spinners with the object of solving common problems; but as no further news has been received, one can merely assume that no general solution was found.

The Henequén industry appears to have had a fate similar to that of the oil industry of Mexico by coming under governmental control, the Sisal estates having been taken over and subdivided amongst the workers. The outcome of this important change may not be apparent for some time. Meanwhile the industry continues to be administered by the *Co-operativa de Henequeneros de Yucatán* under the new decrees.

On the method of cultivation of Henequén in Mexico, only very few reliable reports are available. Dewey some seven years ago gave the following details:—

The Henequén plant is regarded as native in the Yucatán Peninsula, but is not known in a wild condition except as an escape from cultivation. The plantations in Yucatán are all within the tropics and in areas entirely free from frost. The average rainfall in the Henequén-growing areas of Yucatán is about 750 mm. and the lowest recorded temperature is 10° C. Henequén endures drought better than Sisal, but in a protracted drought its leaves also become leathery, making it very difficult to clean the fibre.

Henequén requires a soil with good natural drainage. The plantations in Yucatán are mostly on porous lime rock, through which water from rains quickly sinks to the underground river. There are no streams or natural ponds on the surface in northern Yucatán.

Henequén grows best in the full sunlight. It is necessary therefore, to cut all trees and bushes. The bush and herbaceous weeds and grass are all burnt, and the land is cleared as

thoroughly as possible. Ploughing is practised where possible, but most Henequén plantations are on land too rocky for ploughing and regular cultivation. It is usually necessary to clear the land two to four times each year until the first harvest of leaves, or even oftener in regions of greater rainfall. Afterwards the land is cleared at the time of each harvest.

Particular attention is given to the size of the planted area and the number of plants thereon, for this is the basis of all field labour and estimates of production. Generally 2,400 plants per hectare are planted and suckers are used for planting. The roots and outer leaves are trimmed off. Small holes are dug, often with a pick, in rocky lands, and the bulb is set and partly covered with earth. In rocky land it is often necessary to prop up the suckers with small stones. After planting, the field is inspected at frequent intervals, and suckers that have fallen over are straightened up and those that fail to grow are replaced.

In Yucatán the first leave are cut in the sixth or seventh year, and afterwards usually two crops per year are cut for periods varying from ten to twenty years, or until many of the plants cease to put forward good leaves.

The leaves are cut one at a time with an ordinary butcher's knife. The terminal spine and marginal prickles are trimmed off and the leaves are tied in bundles, 40 or 50 per bundle. One man, with two assistants to trim off prickles, count, and tie the leaves in bundles and carry them to the roadway may cut 3,000 to 4,000 leaves per day.

## VII. — Fibre extraction, grading and packing.

In the early times of fibre extraction raspadores were used. These are decorticators, single wheel-machines, where the wheel revolves rapidly in a case, with projections on its circumference, and a smooth metal surface. The workman puts the leaf into the raspador first from one side and then from the other so that the fibres remain. This machine was a great advance on the old process of hand scraping.

Nowadays on the big plantations completely automatic machines are used. The leaves on arrival at the factory are placed on endless-chain carriers, which convey them to the specially constructed decorticators, where they are drawn through two narrow passages, each bounded by a rapidly revolving solid wheel, with projections on its circumference and a smooth metal surface. The two wheels are on opposite sides of the machine, and revolve in opposite directions. In its passage between these wheels and the metal surfaces each leaf is scraped and the soft tissues removed, first along one half and then along the other. The fibres are washed immediately after each scraping process by a strong jet of water, which effectively removes the cortical tissues. This water containing bits of fibre and pulp, is then led in channels from the machines.

The fibre, on passing from the decorticators, is placed in centrifugal machines, where it is further washed by means of a jet of water which plays on the fibre for three minutes after the machine has been set in motion. The machines continue running for six minutes after the jets of water have been stopped. This removes excess of water from the fibre.

On completion of the washing process, the fibre is dried in large drying chambers through which steam pipes pass. Each drying chamber is also provided with a fan for the purpose of keeping the dry air in circulation.

In the dry, hot countries the fibres are mostly dried in the open air exposed to the sun, this having a good bleaching effect on the fibres.

The dried fibres are then beaten by hand labour on wooden bars supported about one metre above the ground or brushed by brushing machines constructed like the single-wheel decorticators having, in place of the projections, brushes on their circumference. These operations free the fibres from the remnants of cellular tissue adhering.

The fibre is then graded into three classes according to length, No. I class comprising lengths over 1 metre, No. II class comprising fibres of between 75 and 100 centimetres, and No. III class those of 50 to 75 centimetres.

Besides these there exists another class known as "tow". This contains short ends produced in the process of trimming the tufts of fibres during the grading operation. In this class is also graded the fibre cleaned from the bagasse.

The fibres ready for delivery to the trade are pressed into bales, containing 400 pounds or 200 kilogrammes each. The bales are fastened by thin strong wires without cover-mats.

### VIII. — Recent scientific research-work.

Although the Sisal plant is outstanding in many respects as a fibre producer, the possibility always exists that more profitable varieties may be found or may be obtainable by breeding. *Hindorf* was one of the earliest writers to draw attention to this possibility, and also advocated intensive selection from among the established plantations in East Africa. But historical and cytological evidence indicates that *Agave sisalana*, in East Africa and probably universally, is a clone, i. e. the vegetatively propagated offspring of a single original plant. It is the general experience that selection within a clone does not lead to any great improvement. *Hindorf* sought diligently for seeds of this species, and is the first to record the production of fruits and seeds on cut poles.

#### Breeding.

Breeding experiments with Agaves were started at Amani (Tanganyika Territory) in 1929. Among the desirable characters of a fibre Agave are:

- (1) High yield.
- (2) Good quality of fibre.
- (3) A hardy and adaptable plant.
- (4) A plant easily and cheaply cultivated.

#### I. — Yield.

Yield is determined by the number of leaves produced and the amount of fibre in the leaf. The number of leaves produced during the life of the Sisal plant does not appear, from the limited data available, to vary greatly between individual plants grown under similar conditions. The number and size of the leaves produced are interdependent and largely influenced by environment.

For increased production, therefore, a more rapidly growing form with a higher total production of heavy leaves is indicated. In naturally occurring species prolific leaf production is usually concomittant with small leaves, but this does not mean that a combination of the characters for numerous and large leaves is unattainable.

In the Sisal Experiment Station of Ngomeni an experiment is in progress to compare different species of Agave.

*Agave angustifolia* Haw. was found to be a species outstanding for rapidity of growth and total leaf production. The plants under observation at Amani put on new leaves at approximately three times the rate of *Agave sisalana*. However, the leaf is short, light and contains only a small weight of fibre. The leaf margin is spiny, the fibre very fine. The maximum number of leaves produced by a plant of this species during its productive life is 510, compared with a maximum for Sisal of 230 under similar conditions. It is sexually fertile.

It is the aim of the selectionists to combine the prolific properties of *angustifolia* with the good and abundant fibre production of *sisalana* by cross-breeding. Successes are already being obtained.

*Agave amaniensis* Trelease and Nowell (Blue Sisal). The origin of this species is obscure, but it is said to have been imported from Berlin Botanical Gardens before the War, and was found growing under heavy shade in the Amani plantations. Producing a long heavy leaf with a non-spiny margin and containing a very fine fibre, this species is most promising. A sample of the fibre has been examined in a London laboratory. From the data obtained, it follows that a smaller weight of *Agave amaniensis* fibre would be required than of Sisal for rope of the same size, and the former fibre would be more economical. It is also somewhat lighter to handle. In consequence of its sexual fertility, a large number of seedlings have already been raised. These show segregations of forms with spiny and non-spiny margins.

■ Besides these two most promising species, many others – totalling 88 species and varieties – are grown in Amani and a great number of cross-breeds are in progress.

The Sisal grower would like an improvement in the proportion of fibre to leaf weight, but little indication is available that this can be obtained with any of the species till now under observation. In most species of Agave, the proportion of fibre is about the same as for Sisal. In Java a new species of Agave has been found which does not develop a flower stalk; it has as yet produced 600 leaves per plant.

## 2. — Good quality of fibres.

The fibres derived from Agave species form the conducting and supporting tissue of the leaf. The distribution of the fibres in the leaf tissue does not in general vary greatly in any of the species examined.

The general standard of quality of common Sisal fibre is considered quite satisfactory by the consumer for the purposes to which it is now put. Length, colour and strength are the main points considered in marketing. The Imperial Economic Committee in England points out that the absorption of supplies

depends largely on finding extended uses for this kind of fibre. From other sides it is stated that the future policy of the grower must be directed towards producing finer fibre. Therefore, a good deal of attention has been given to the conversion of Sisal fibre into a material suitable for fine spinning, in order to replace the softer fibres used in commerce. In the breeding programme, an important place has been given to the physical qualities of the fibre.

Colour of the fibre is connected with clean decortication. Leaves containing very fine fibre seem to be more difficult to decorticate cleanly, but this may be only a matter of mechanical adjustment and not a serious difficulty.

### 3. — *Hardy and adaptable plant.*

The Sisal plant is cultivated over a wide range of conditions. It is adaptable and singularly free from attack by serious pests and diseases. Only one species, the *Agave ingens*, appears to be very susceptible to attack by the Sisal weevil. Another, the *Agave Lespinassei*, is liable to diseases which are said to be due to soil deficiencies, banding disease, leaf scorch etc., susceptibilities to be looked for by the plant-breeder since they may be a serious drawback in otherwise promising types.

### 4. — *Good cultivable plant.*

The presence of spines on the leaf margin is a great disadvantage in cultivation. Plants with marginal spines take much longer to cut and are more difficult to cultivate than those without. The breeding of stable forms with non-spiny leaf margins is of great importance. The absence of marginal spines in *Agave sisalana* is not an immutable character, and *Agave amaniensis* (blue Sisal), typically a non-spiny form, occasionally produces bulbils and suckers with marginal spines.

## Morphology of fibres.

Further investigations into the morphological, histological and mechanical properties of Agave fibres are being carried out in Amani. Nutman, plant physiologist of Amani, has given many details which may be found in the « Empire Journal of Experimental Agriculture » 1937 vol. V, pp. 75-111.

From his investigations it is learnt that fibre-fineness is only a question of species and not of leaf length. In view of the uncertainty as to the requirements of spinners, certain planters have cut their leaves while still short or have deliberately planted Sisal on areas where conditions give rise to a short leaf with the intention of producing a finer fibre at the sacrifice of length. The results show that this course will have little of the desired effect. If fineness is to be regarded as a desideratum, it can more readily be obtained by planting *A. amaniensis* or *A. cantala* which will produce fibres which are markedly finer than the fibres of *A. sisalana*.

The leaf of *Agave amaniensis* also contains many more and longer fibres than does *Agave sisalana*, and the proportion of mechanical to "ribbon" fibres is twice as great in the former.

### Grading problems.

The experiments of *Nutman* have considerable bearing on the problems involved in the grading of the finished commercial product.

Till recently little information has been available on the fibre as it exists in the plant, as it is commercially shipped or as it passes through the various stages of manufacture. As a natural result, the personal opinions of both the producer and the consumer have become elevated to the rank of dogma.

Before considering grading in detail, it is advisable to assess the range of leaf-length which is normally obtainable on a well-run commercial estate. An adequately representative selection of the leaves to be measured can easily be obtained by taking leaves at random from the rapidly moving belt on which they are carried to the decorticator. Frequency distributions of leaf length proved to be from 45 to 155 centimetres.

As these leaves pass into the decorticator at random and as in each leaf the range of the fibre is from zero to the whole length of the leaf, it is obvious that the hank being bundled at the exit end of the decorticator contains fibres of the most different lengths. An aggregate of separate hanks passes through the handling processes, and the individuality of the hanks of each leaf is lost.

But also, if the leaves are graded according to lengths, and if each grade of the commercial product is fibre produced from a leaf of a given minimum length, each leaf contributes its complement of long and short fibres to the final commercial product.

However, a recent tendency has arisen to try to grade Sisal fibre on the basis of a minimum fibre length. The initiative in this direction has apparently come from the spinners, who claim that a minimum fibre length of 1 metre ( $3 \frac{1}{4}$  feet) for No. 1 fibre is necessary for efficient manufacture. This may well be true, but there does not exist any evidence on which this statement is based, nor does any attempt appear to have been made to confirm it by experimental means. It is quite certain that, at any rate up till recent years, such a material has not been prepared. In the absence of evidence as to the desirability of such a product, the necessity for grading on the new basis will depend on the state of the markets and the firmness or otherwise of the buyers' demands for a product of which they have, as yet, no experience.

It may be possible to combine grading on the basis of a minimum fibre length with the process of decortication. But this would prove uneconomical on most estates on account of the big percentage of waste produced in this way. Thus, it does not appear probable that the majority of Sisal-growing areas will find it possible to grade on a basis of a fairly high minimum fibre length unless some other Agave is substituted for *Agave sisalana*. The use of *Agave amaniensis* may conceivably solve this problem, since for a leaf length of 180 centimetres the waste would be less than 30 per cent. grading on a 90 centimetres minimum length. This length of leaf is, so far as our experience with this plant goes, likely to be obtained under the conditions prevailing in most of the Sisal-growing areas in Tanganyika.

It should, in addition, be noted that the longer fibres are also the coarser ones in any leaf, so that by removing the shorter fibres a coarser product will result. The future will decide whether a coarse, long uniform product is to be preferred to the fibre as at present shipped.

## **INTERNATIONAL CHRONICLE OF AGRICULTURE**

### **BRAZIL**

Brazil's balance of trade in 1938 was a favorable one, but the surplus of exports was not great. Imports and exports amounted to 32,712,000 and 32,993,000 gold pounds respectively, giving a surplus of exports of 281,000 gold pounds.

Brazil continues to follow the two principal aims of her agricultural policy:— no longer to devote herself exclusively to the one product, coffee; and to replace her former policy of maintaining coffee prices by a new policy of free competition in world markets and of increasing home consumption to the maximum, so that only so much need be exported as will secure the foreign exchange needed for the payment of the external debt.

### Coffee market.

On December 31, 1938 the first year of the new system of free competition came to an end, and the export figures for 1938 have been very much as expected. As the following figures show exports reached the highest figure for the last five years:—

1934 . . . . .	14,146,879	sacks of 60 kilogrammes
1935 . . . . .	15,328,791	» 60 »
1936 . . . . .	14,185,506	» 60 »
1937 . . . . .	12,122,809	» 60 »
1938 . . . . .	17,208,088	» 60 »

Of the last ten years only 1931 was able to show higher exports than 1938, 17,850,872 sacks having been exported in that year. The 1938 figure would also certainly have exceeded the 1931 figure, had it not been for two factors, one of which tended to lower the 1938 figure, the other to raise the 1931 figure. In 1938 U. S. A. dealers, not wishing to end the year with large stocks, reduced their purchases in November and December; whilst in 1931 an agreement between the *Conselho Nacional do Café* and the "Grain Stabilisation Board" arranged exchanges of North American wheat against Brazilian coffee, which naturally increased the exports of the latter product considerably.

The policy of free competition on world markets, which has resulted in the selling of coffee at lower prices, has not, however, had any unfavourable effect on the trade balance, because the lower level of prices has been compensated by the greater volume of sales. In 1938 5 million more sacks were sold than in 1937 instead of being burnt, and these 5 million sacks gave work to both the land and sea transport services, paid taxes, earned commissions, and helped towards the regaining of markets lost by the previous policy of high prices.

### Cotton market.

The second place in Brazil's agricultural is now occupied by cotton. The last crop may be reckoned at 433,500 tons, of which 200,000 were produced in the State of São Paulo, 130,000 tons in the cotton states of the north, and the remainder in the southern states other than São Paulo.

For the first two months of the present year prices have remained at the average level of last year, that is to say varying from 45 to 50 milreis per arroba. These prices are low for the world market, but they are remunerative for Brazil where the costs of cultivation and of harvesting are low.

Being closely bound to the world market Brazil is affected by the great U. S. A. market. The restriction of sales in the Brazilian market, although less pronounced than in the U. S. A., has been rendered inevitable by the situation of the world cotton market. The great stocks of cotton accumulated in the U. S. A. have their effects also on Brazil. However sales have been increased to 280,000 tons, the principal buyer being Germany with 80,000 tons, then Japan with 60,000 tons, Britain with about 40,000 tons and France with 28,000 tons, the remainder having been taken by other European countries. These exports had a value of £ 14,000,000.

The increasing importance of cotton in the Brazilian economy has also been the cause of the extension of the cotton area in São Paulo State. In that State the new movement towards polyculture was specially necessary, as previously the production of coffee had absorbed almost all its energies. At present, as we have seen, it is the main area for cotton production and cotton export, almost all of the German purchases

of cotton being from São Paulo State. Whereas in 1933 it only exported 50,000 tons, in the succeeding years the cotton exports of São Paulo have been as follows:—

1934	62,670 tons
1935	56,911 "
1936	132,424 "
1937	152,323 "
1938	200,000 "

The value of the exports in this last year amounted to about 700,000 contos, so that if to this are added the 140,000 contos from the by-products of cotton (oil-cakes, seed and other residues) a total of about £ 10,000,000 is obtained. This figure for the cotton exports of the State of São Paulo represents 71.43 per cent. of the total value of Brazil's cotton exports in 1938, which was about £ 14,000,000.

### Sugar market.

On December 31, 1938, the production of refined sugar for the season 1938-39 reached 9,265,365 sacks, which was the highest production for the last four years, as the following statistics of production show:—

1935-36	9,150,648 sacks of 60 kilogrammes
1936-37	8,710,320 " 60 "
1937-38	9,247,115 " 60 "
1938-39	9,265,365 " 60 "

The situation in the six sugar-producing States in 1938-39 has been as follows:—

*Pernambuco* has produced 2,869,419 sacks, which was more than in the two previous seasons when production amounted to 1,817,651 and 2,229,113 sacks respectively. This abundant production was due to the excellent atmospheric conditions which were very favourable for the cane.

*Alagoas* has produced 790,207 sacks, and thus exceeds the productions of 1936-1937 and 1937-38 which were 515,340 and 603,163 sacks respectively. The high production was due to the same causes as in Pernambuco.

*Sergipe* has a lower production than in previous years—only 357,616 sacks as against 447,825 and 437,302 sacks in 1936-37 and 1937-38 respectively. The decrease was due to a reduction in the area cultivated and also to the bad atmospheric conditions.

*Bahia* showed a decline in production, for the same reasons as Sergipe, from 451,265 and 487,888 sacks in 1936-37 and 1937-38 respectively to 384,201 sacks in the current season.

*Rio de Janeiro* and *São Paulo* are the most important sugar-producing states of the south, production being so great that restrictive measures have become necessary. For Rio the quota was fixed at 2,016,916 sacks and the actual production was 1,977,780 sacks, but this slight deficit of 41,136 sacks does not suffice to alter the situation. For São Paulo the quota as fixed by law was 2,073,241 sacks, but it was exceeded by 124,596 sacks as production was 2,197,837 sacks. São Paulo is the second sugar-producing state of Brazil and would be the first, were it not for the restrictions on production imposed by law. These figures show the success of the new movement towards polyculture, for São Paulo used to produce almost nothing but coffee, whereas now it adds to the national wealth by its production of sugar and cotton.

The Institute of Alcohol and of Sugar, which controls the production and consumption of the latter commodity, has succeeded in stabilising prices, which now fluctuate round 45 milreis per sack of 60 kilogrammes. To achieve this result, the Institute each

year fixes the area which must be cultivated in order to satisfy the demands of consumers; if there are surpluses it has a special scheme for dealing with them, putting aside a part for the years of low production and disposing of the remainder in foreign markets.

### Fruit market.

The great improvement in methods of cultivation and the winning of new markets has resulted in an extension of fruit production within recent years, and now a part of the production is exported.

*Citrus fruits.* — The official production figures of these fruits show the growth of production and exports from 1932 to 1937-38:—

	Production (Tons)	Exports (Barrels)	Exports (Contos)
1932-33 . . . . .	700,000	2,544,258	54,894
1937-38 . . . . .	1,480,000	4,970,858	123,858

Methods of production are becoming ever more intensive, the area of cultivation is extending, the different varieties are being subject to selection and at the same time the greatest care is being devoted to the transport of the product. A refrigerator of great capacity has been set up in the port of Santos, and the ships which transport the product have been supplied with the most up-to-date refrigerating plant. In 1938 the United Kingdom took about 51 per cent. of the citrus fruits exported from Brazil (as against 23 per cent. of those from Argentine).

*Bananas.* — The cultivation of bananas is making as much progress as that of the citrus fruits. The statistics are as follows:—

	Production (Tons)	Exports (Tons)	Exports (Contos)
1932-33 . . . . .	908,000	157,000	98,000
1937-38 . . . . .	1,517,000	225,000	150,000

Among the purchasers of Brazilian bananas the Argentine occupies first place, taking 74 per cent. of Brazil's exports, followed by the United Kingdom with 17 per cent. and Uruguay with 7 per cent. Since the banana is a very perishable commodity exports on a large scale are hardly possible without the use of the most modern refrigeration plant.

### Wheat market.

Brazil imports the wheat and flour needed for home consumption, but has recently started a campaign to decrease these imports as much as possible. Wheat imports now represent about 20 per cent. of total imports.

Last season's harvest, which was about 1,700,000 quintals, only covers 15 per cent. of consumption requirements, and it will be necessary again to import the usual quantity of 10 million quintals in order to have the 12 million quintals needed to satisfy consumption requirements.

### Agricultural credit.

On December 23, 1938 three important Decree-laws, Nos. 1001, 1002 and 1003, were issue regulating agricultural debts. The importance of these Decrees is not, however, merely economic and does not lie only in the high amount of these debts, but is also juridicial, because they depart from legal principles till now in force in almost all countries.

Decree-law No. 1,001 prolongs the moratorium on agricultural debts established in 1937 till December 31, 1939, and clearly defines the class of agriculturalist able to benefit from this Decree. To counter-balance the effects of the moratorium on payments, Decree-law No. 1,002 authorises the Bank of Brazil to issue mortgage bills at 5 per cent., negotiable on stock exchanges, so that it may obtain the funds to grant loans with mortgage guarantee to agriculturalists in order that the latter may be able to pay their debts contracted previous to 1937. Debtors will be entitled to loans up to 75 per cent. of the total of their previous debts.

The third Decree-law, No. 1,003, enables the Bank of Brazil to grant certain advantages in respect of agricultural mortgages and to protect the mortgaged property of agriculturalists.

## FRANCE

Since the beginning of December 1938 the position of the franc has improved, not only in relation to sterling, but also in relation to the dollar and to gold.

At the beginning of January 1939 the Bank of France was able to lower its discount rate from 2  $\frac{1}{2}$  to 2 per cent.

The tendency for the internal price level to rise persisted up to February 1939, since when, however, prices have slightly weakened. Thus the weighted general index of the wholesale prices of 126 commodities prepared by [the *Statistique Générale de la France* (base 1913 = 100)] rose by stages from 664 at the end of October 1938 to 689 at the end of January 1939, then falling slightly to 683 by the end of March. Yet despite this slight improvement of the franc in relation to foreign currencies and this slow but steady rise of internal prices the difference between French prices and foreign prices remained sufficient to stimulate exports so that these have shown a favorable tendency. This stimulating action, however, favours industry rather than agriculture, because French agriculture in general is not for export. Nevertheless, French agriculture is in a good position in spite of various signs that the risks of over-production may become serious.

It is indeed clear that the cereal harvests were very good. Wine production in the metropolitan area nearly reached 58 million hectolitres as against 51 millions in 1937. Taking account of the Algerian production and of the accumulated stocks the total quantity of wine for marketing exceeds 87 million hectolitres, to which must further be added the imports coming from Tunisia, that is to say about 1 million hectolitres. Among the chief agricultural products sugar beet is the only one of which the production showed a decline in 1938 as compared to 1937. The frosts of December 1938 destroyed some of the wheat in the ground. The health of the live-stock has improved, and foot and mouth disease is clearly on the decline.

Yet in spite of this abundant production, the prices of the main agricultural products have remained very firm. The weighted index of the prices of 39 agricultural products and foodstuffs calculated by the *Statistique Générale de la France* (base 1913 = 100) was 688 at the end of January 1939 as against 634 at the end of January 1938 and 646 at the end of October 1938. Admittedly, at the end of March there was a weakening to 671, but even so the index was above the March 1938 figure of 620. The index of the prices of the 24 products of vegetable origin only rose slightly from 628 at the end of October 1938 to 635 at the end of November, and more noticeably to 656 at the end of December 1938 and to 668 at the end of January 1939. By the end of March it had weakened to 660.

Wheat prices, which are rigidly fixed by the Wheat Office, now show only a steady rise throughout the season. In comparison to the previous season wholesale prices of wheat showed a rise, but owing to the incidence of various taxes the prices actually received by the producer have fallen. As regards the secondary cereals, they continued to fall except in December 1938 and January 1939, when they recovered somewhat. Maize prices also showed an upward trend, but this is mainly an imported commodity. Wine prices after having slightly weakened in January 1939 recovered in February, whilst in March they kept almost steady. Sugar prices are rising owing to insufficient production. The price index of animal products rose sharply from 675 at the end of October 1938 to 706 at the end of November. The rise from 706 in November to 729 in December 1938 must be considered as mainly a seasonal phenomenon—even though the index for December 1937 was only 671. This index was very much affected by the prices of the milk products which have risen considerably because of the lessened milk production resulting from the intense cold. It slightly weakened to 721 at the end of January 1939, fell back to 683 for the end of February, but then rose a little in March to settle down at 690 at the end of the month. March also saw quite a noticeable recovery in meat prices.

### Commercial policy.

France has concluded a new agreement with Norway. Her commercial treaty with Siam, signed on December 7, 1937, entered into force on March 7, 1939; it contains the most favoured nation clause <sup>(1)</sup>. The commercial treaty between France and the U. S. S. R. has been prolonged till December 31, 1939 <sup>(2)</sup>, and the commercial agreement between France and Venezuela has been renewed.

On December 6, 1938 France concluded an agreement on commercial payments with Bulgaria to replace that of July 6, 1936. This new agreement entered into force on January 1, 1939. It can be denounced at any time on the giving of three months notice.

The list of goods of Bulgarian origin which were and continue to be admitted at the minimum tariff rate, as stipulated in the Franco-Bulgarian Convention of October 22, 1925, was completed by a Decree of January 17, 1939 <sup>(3)</sup>. Of the products of interest to this report the original list included cereals, brans, cheeses, the oil-yielding crops and oil-cakes. The recent decree has added wheat, spelt and maslin flours meat and butter.

For some years the trade between France and Yugoslavia has been declining to such an extent that in 1938 France's share in the foreign trade of Yugoslavia was only 2 per cent., her purchases in Yugoslavia in that year having only amounted to 100 million francs with her sales at a correspondingly low level. Yugoslavia indeed owing to transfer difficulties had to adopt severe measures of exchange control, and does not import from any country more than she exports to it. Thus it was that in 1938 owing to lack of means of payment she had considerably to reduce her purchases of French goods. But the increase of Yugoslav imports into France meets with the fundamental difficulty that Yugoslav prices are in general higher than French ones.

France has negotiated a commercial treaty with Yugoslavia which was concluded on February 11, 1939, and the French government has taken the necessary steps by the Decrees of March 31, 1939 for the putting into effect of this agreement <sup>(4)</sup>.

---

<sup>(1)</sup> *Journal Officiel*, March 7, 1939. — <sup>(2)</sup> *Journal Officiel*, December 31, 1939. — <sup>(3)</sup> *Journal Officiel*, January 18, 1939. — <sup>(4)</sup> *Journal Officiel*, April 1, 1939.

The terms of this agreement should allow of a considerable increase in the trade between France and Yugoslavia. By opening wider the doors of the French market to Yugoslav products exports of French goods to Yugoslavia should be increased, and at the same time the transfer of French financial credits in Yugoslavia should be rendered easier. To close the gap between French and Yugoslav prices France grants to Yugoslavia the tariff rebates determined on at the Stresa Conference. These rebates, the value of which does not exceed 8 million francs, have the sole aim of facilitating the more complete utilization of the quotas granted to Yugoslavia.

The imports of salted pork of Yugoslav origin will be exempted from the special quota tax up to a limit of 1000 quintals. A special system has been set up to facilitate the export of quotas of maize by Yugoslavia, a system which has also been extended to some other Danubian countries. All these measures are so framed as not in any way to infringe the protection accorded to the agriculture of France or her colonies <sup>(1)</sup>.

At the same time efforts will be made systematically to increase French purchases in Yugoslavia by means of a better organisation of the contacts between the two markets, a task to which the Franco-Yugoslav chamber of agriculture and chamber of commerce will especially devote themselves.

On their importation into France young wethers and ewes of Yugoslav origin, as also the fresh and the frozen meat of such young animals, will be subjected without any reduction to the duties of the French minimum tariff. However, where such animals result from a crossing with breeding animals imported from France and entered in the pedigree stock-books a rebate will be granted equal to the difference between the normal duty of the minimum tariff and the duty of 102.50 francs per 100 kilogrammes within the limit of the quota available for Yugoslavia. Whilst as regards the imports of fresh, chilled and frozen meat of young wethers and ewes resulting from a crossing with breeding animals imported from France and entered in the pedigree stock-books, a rebate will be granted equal to the difference between the normal duty of the minimum tariff and the duty of 138.40 francs per 100 kilogrammes. These clauses relating to young wethers and ewes resulting from a crossing with breeding animals imported from France and to fresh, chilled and frozen meat derived from such animals are identical with those to be found in the agreement of December 13, 1937 between France and Poland. Also the recent exchange of letters of March 31, 1939 between France and Romania <sup>(2)</sup> contains similar clauses as too does the agreement of February 4, 1939 between France and Hungary <sup>(3)</sup>.

France has concluded an agreement on commercial payments with Yugoslavia <sup>(4)</sup>, this agreement to replace the similar agreement of December 14, 1937 and to enter into force on March 1, 1939.

By the terms of this agreement the Yugoslav Government promises to grant without delay and not subject to any restrictions the permits necessary for the import and for the making of payment for the goods of French origin figuring on the list of goods subject to import control in Yugoslavia, this promise to hold good as long as the value of French (including Algerian) sales in Yugoslavia does not exceed 60 per cent. of the value of Yugoslav sales in France. In the month following on each quarter the balance of trade between the two countries will be examined, for which purpose the statistics used will be those of Yugoslav imports on the one side and French and Algerian imports on the other, account being taken of the exchange fluctuations which have taken place in the

<sup>(1)</sup> For the colonies see the Chronicle on the French colonies. — <sup>(2)</sup> *Journal Officiel*, April 26, 1938. — <sup>(3)</sup> *Journal Officiel*, April 30, 1938. — <sup>(4)</sup> *Journal Officiel*, March 3, 1939.

period. A mixed committee of French and Yugoslav civil servants will be appointed to see to the good working of the payments agreement and to devise all possible measures for the furthering of commercial relations between the two countries, whilst at the same time seeing that the agreed proportions are maintained. In principle this committee is to meet every six months and whenever else the two governments think necessary.

France has also concluded a commercial agreement with Sweden, to regulate the commercial relations between the two countries for 1939. The concessions granted to France for the year 1938 by the previous agreement will be maintained and on certain matters extended, in particular as regards the export of wines and liqueurs.

France has also concluded payments agreements with Poland and Romania.

The agreement with Poland, concluded on March 27, 1939, entered into force on April 1 <sup>(1)</sup>. In principle it is valid for the year 1939, but may, however, be denounced during the course of the year on the giving of fifteen days' notice. The total value of the French imports into Poland effected according to the terms of the trade agreements between the two countries, is fixed at 80 per cent. of the total of Polish exports to France as calculated from the Polish export statistics. The effective maintenance of this relationship will be assured by a special committee composed of delegates of the two governments which will decide on the adjustments to be made each three months from the experience obtained in the preceeding three months.

The agreement with Romania concluded on March 31, 1939 entered into force on April 8 <sup>(2)</sup> to replace the agreement on commercial payments of March 8, 1938. It can be denounced on the giving of three months' notice. Commercial payments will be made in free exchange. As from the date of the entry into force of this agreement all sums paid by French importers in settlement of the purchase of goods of Romanian origin to France immediately on receipt will be placed in a French franc account at the National Bank of Romania. As regards the import into France of certain goods of Romanian origin listed in an annex to the agreement, the parties will have the right to arrange compensation dealings against the imports of certain specified French goods into Romania. Both these lists of goods are subject to modification, but that of the Romanian goods imported into France includes the following among the products of interest to this Chronicle:— rye, brewers' malt, gluten, food pastes and meals, live sheep, meats, dead poultry, dead game, the skins and furs of many domestic and wild animals, butter, margarine, edible animal fats, cheeses, many vegetable oils, sugar and molasses, wines, table grapes and fruits.

Romanian exporters will have to cede to the National Bank of Romania a percentage varying according to the commodity exported of the foreign exchange due to them in settlement of the price of the goods imported into France under this system. These percentages are as follows:— 40 per cent. for rye; 30 per cent. for all animal skins and furs except those from hares, rabbits and cats; 25 per cent. for molasses; 20 to 25 per cent. for vegetable oils; 15 per cent. for brewer's malt, food pastes and meals; 10 per cent. for gluten, live animals, meats, margarine, fats, cheeses, sugar, table grapes and fruits. The sums representing the price of goods after deduction of these percentages may be freely transferred to third parties by the exporters concerned at any rate agreed upon by the buyer and the seller. They can only be used, however, in settlement of the purchase of goods of French origin imported into Romania after the entry into force of this agreement. Other commercial payments made by French importers will be placed by the National Bank of Romania to different accounts;

<sup>(1)</sup> *Journal Officiel*, April 1, 1939. — <sup>(2)</sup> *Journal Officiel*, April, 7, 1939.

but except for those made in settlement of the purchase of petrol 20 per cent. will be left at the disposal of the Romanian exporters so that they may be able to cede them freely to third parties.

### Wheat market.

*The Working of the Wheat Office.* — The working of the Wheat Office was made easier during the first two years of its existence by the fact that the successive harvests of 1936 and 1937 were very moderate, so that the problem of disposal of excess supplies was not in fact raised during this period.

In the season which began in the summer of 1938 the Office was for the first time faced with the problem of an excess supply. This supply indeed appears even to have exceeded the estimates made by the Office in the summer of 1938 and reproduced in our Bulletin of September, 1938. Hence arose certain difficulties for the financial stability of the Office.

As the Treasury had to make an advance to the Office, the central committee of the Office could not do other than maintain the increase of 50 per cent. on the exceptional tax for the reabsorption of excess supplies which is levied on wheat producers <sup>(1)</sup> The base rate of this tax, it may be remembered, had been originally fixed at 12 francs the quintal; with the increase the present base rate is thus 18 francs. Furthermore, it must be remembered that this tax is progressive.

However, the council has reserved to itself the right to restore a part of the tax to the producers at the end of the season if the financial situation of the Office then permits of such a course.

It is to be foreseen that in the coming summer, as a result of the frosts of December 1938, the Office will have to deal with a much smaller harvest than last year.

It was desired to facilitate the resowing of the lands in cases where these frosts had wrought much havoc. The farmers who will be able to show that, between the date of the frosts and April 20, 1939, they purchased seed wheat for purposes of resowing from co-operatives or dealers allowed to effect such sales will be granted exemption, on an amount not exceeding the quantity of wheat thus purchased, from the exceptional reabsorption tax of which we have already made mention <sup>(2)</sup>.

As regards the allocation of quotas for wheat sales in order thus indirectly to limit production <sup>(3)</sup>, this will not be carried out for the season 1938-39.

Attempts have been made to increase the consumption of wheat. The coefficient of extraction has been fixed at 2 points below the specific average weight of the wheats to be ground in each mill. This measure will make it possible at one and the same time to increase the quantity of wheat ground by the mills and to improve the quality of the flours without, however, provoking a rise in flour prices.

Under the auspices of the Wheat Office a national propaganda committee has been set up in order to increase the consumption of bread.

The professional organisation of the milling industry is in close contact with the Wheat Office, with the object of equalising the working capacity of the mills and the production of wheat. Membership of the organisation of the milling industry is open to all individuals, firms or cooperatives in France working at the production of wheat flours destined for human consumption and accepting the statutes of the orga-

---

<sup>(1)</sup> See the Chronicle for France in the September, 1938 number of this *Bulletin*. — <sup>(2)</sup> *Journal Officiel*, March 7, 1939. <sup>(3)</sup> See the Chronicle for France in the December 1938 number of this *Bulletin*.

nisation. It is governed by an administrative council and includes departmental and regional committees. The statutes were approved by decree on February 10, 1939 <sup>(1)</sup>.

*Imports from foreign countries.* — It is well known that France generally imports from foreign countries only hard wheats and seed wheats.

Permits to import hard wheat from abroad are only granted on payment of 16 francs per quintal imported to the Wheat Office <sup>(2)</sup>.

Seed wheat imported before April 15, 1939 will be exempted from customs duty and from all taxes levied for the profit of the Wheat Office <sup>(3)</sup>. The purpose of this exemption is to facilitate the resowing of the wheat lands affected by the frosts of December 1938.

### Barley market.

The quota of barley for brewing has been reduced to 5,000 quintals for the first quarter of 1939 <sup>(4)</sup>.

### Meat market.

The bounty on the export of fat salted pork and on salted streaky and middle cuts has been fixed at 1 franc per kilogramme <sup>(5)</sup>.

### Sugar market.

The Government has been concerned about the possible effects on the national economy and on the feeding of the people of the deficiency in the sugar production of the current season. It has, therefore, by four successive decrees authorised the importation of four quotas of sugar, of which the first, of 10,000 tons, was the same as for 1938, whilst of the three supplementary quotas one is of 20,000 tons and the two latest are of 15,000 tons each. The licence tax for foreign sugars, which was 22 francs in 1938, will be 20 francs till May 31, 1939 and 28 francs after that date. As regards imports made up till and including June 15, 1939, payment of the licence tax will entitle importers to a transferable delivery receipt. In order to facilitate the accumulation of stocks in the Paris area a repayment of 20 francs per quintal of sugar subjected to the tax will be made to the holders of such receipts who can show that they have placed in *entrepôt* in Paris and delivered to the regulated market an amount of sugar equivalent to that for which they have receipts <sup>(6)</sup>. In order to encourage subsequent exports, rebates have also been provided for the holders of such receipts who signed obligations for the temporary admission of foreign sugars <sup>(7)</sup>.

### Wine market.

The interministerial commission for viticulture has decided on 8 million hectolitres as the quantity of wine which must be reabsorbed in order to establish equilibrium between the quantity of wine on the market and the demand for that wine. 6.5 million hectolitres it was decided should be reabsorbed by distillation, whilst the remaining 1.5 million hectolitres are to be held back from the market.

---

<sup>(1)</sup> *Journal Officiel*, February 16, 1939. — <sup>(2)</sup> *Journal Officiel*, December 28, 1939. — <sup>(3)</sup> *Journal Officiel*, March 7, 1939. — <sup>(4)</sup> *Journal Officiel*, January 1, 1939. — <sup>(5)</sup> *Journal Officiel*, February 14, 1939. — <sup>(6)</sup> *Journal Officiel*, April 16, 1939. — <sup>(7)</sup> *Journal Officiel*, April 2, 1939.

### Sanitary prohibitions.

In order to protect the livestock of the metropolitan area against epidemics and to prevent the import of foodstuffs from unhealthy stock or from stock suspected of disease, the Government has been authorised to prohibit the import of all animals, wild or domestic, which show signs of contagious disease, of all animals, live or dead, which are unhealthy or suspected of disease, and of all products of animal origin, fresh or preserved, which are diseased or suspected of disease <sup>(1)</sup>.

The import and transit of all cattle, sheep and goats from Switzerland has been prohibited <sup>(2)</sup>.

The prohibition of the import and transit of rodents and their skins coming from Hungary, Romania and Yugoslavia has been suspended <sup>(3)</sup>.

### Agricultural credits.

The budget for the financial year 1939 <sup>(4)</sup> provides that the total of the advances which may be allowed by the State to the National Agricultural Credit Bank shall be increased from 700 to 800 million francs.

## FRENCH COLONIES, PROTECTORATES AND MANDATES

Some of France's commercial agreements are extended also to her colonies.

For example, the trade agreement which France concluded with Bulgaria on October 22, 1925, as also the agreement on commercial payments which she concluded with the same country on December 6, 1938 and to which we refer in the Chronicle for France <sup>(5)</sup>, apply also to France's colonies, protectorates and mandates. Henceforth, products from the French colonies will be assimilated to those coming from France itself, and will therefore receive most-favoured-nation treatment in Bulgaria.

On the other hand, the payments agreement between France and Romania only applies to the metropolitan country and to North Africa <sup>(6)</sup>.

Some of the trade agreements recently concluded by France contain special clauses in favour of the products of colonial agriculture. For example, the special concessions granted to facilitate the importation into France of Yugoslav, Bulgarian and Romanian maize nevertheless safeguard the interests of colonial producers. The quotas of maize imported into France from Yugoslavia, Bulgaria and Romania will not be admitted duty-free except when balanced by exports of maize from the French colonies to foreign markets. Thus the maize of the French colonies which can no longer be sold on the home market will be disposed of in foreign markets.

The traditional tariff system of the colonies—one of more or less complete assimilation between colonies and mother country—in principle afforded protection for the same products and to the same extent in the colonies as in the mother country. The result of this policy has been chiefly to encourage the production of just those commodities which undoubtedly compete with those of the mother country. French policy has, however, recently changed, and the guiding principles of her commercial and co-

---

<sup>(1)</sup> *Journal Officiel*, January 1, 1939. — <sup>(2)</sup> *Journal Officiel*, December 10, 1938. — <sup>(3)</sup> *Journal Officiel*, December 27, 1938. — <sup>(4)</sup> *Journal Officiel*, January 1, 1939. — <sup>(5)</sup> *Journal Officiel*, January 17, 1939. — <sup>(6)</sup> *Journal Officiel*, April 7, 1939.

lonial policy are showing greater flexibility. On the one hand the Government has been led by the pressure of circumstances to take defensive measures against colonial agriculture itself, and on the other hand it is trying to direct colonial agriculture towards products which supplement home agriculture. The sugar producers of the home country and of the colonies have divided the home and the Algerian markets between themselves by agreements which have been officially approved by the Government. A similar agreement has been concluded between the representatives of the oil industries of France itself and of French West Africa, which agreement has been sanctioned by a Decree of April 8, 1938. A committee of semolina producers composed of an equal number of representatives of the home and of the Algerian manufacturers regulates the competition between the home and the Algerian semolina industries. The Government obliges the home industry to use a certain percentage of hard wheat from North Africa, and as this type of wheat is hardly cultivated at all in France the product thus aided is supplementary to French products. French barleys are in little demand for brewing purposes; therefore in order to stimulate the production of malting barley in Morocco this territory has been allocated certain quotas for the import of such barley into France and Algeria free of duty. Efforts have been made to improve the quality and enhance the reputation of the tea from Indo-China. Similarly attempts have been made to develop cotton production in Algeria, in West Africa and in Equatorial Africa, and to stimulate the production of jute and of its substitute, sisal. Bounties on the production of bananas, coffee and rubber have already given excellent results.

The *Conseil National Economique* has recently drawn up a general plan to be carried out over a period of several years for the development of French imperial production. The aim is to replace in the colonies the production of goods which compete with home products by the production of goods which France now has to buy abroad — certain raw materials for industry such as textile materials, fats and woods and certain tropical products such as coffee, tea and exotic fruits. The principal method to this end will be a system of subsidies, which will be financed in the first place by taxes accepted by the producers; but if the producers cannot come to an agreement among themselves or if their contribution proves insufficient, recourse will be had to customs and to export duties. For each main branch of production the *Conseil National Economique* proposes the setting-up of a general committee of producers and traders, composed of delegates from the trade organisations representing the interests of home and of colonial agriculture, of commerce and of the consuming industries, and including an effective representation of the various government departments concerned. All these committees will have a similar constitution and organisation, to be approved by the State.

The report of the *Conseil National Economique* suggests that it would be possible to develop cotton production, especially in North Africa, in West Africa, and in Equatorial Africa, and therefore proposes the granting of bounties on cotton production in those colonies. As regards the oil-yielding crops, it commends the development of the production of linseed in Morocco, not by means of financial support, however, but rather by the aid of the agricultural services; and similarly for Tung oil. As regards ground-nuts the report suggests that efforts be made to improve the selection and to reduce the cost of transport. It also recommends the development of orange and mandarine production. Further, the report deals with the development of the colonial forests, from which the home country already draws a very large part of the wood imported for building purposes and for cabinet-making; and here it chiefly recommends the improvement of transport conditions and the reduction of freight rates, especially for sawn and peeled woods, whilst also suggesting a "users preference" for French and colonial woods.

## North Africa.

The economic situation of North Africa is steadily improving. The exports from Morocco of cereals, wines, early fruits and vegetables, and sheep are increasing. However, the exports of agricultural products from Morocco to France and Algeria show a very noticeable decrease, the "open door" policy which applies to Morocco as to the mandated territories naturally favouring trade with foreign countries; Moroccan exports to Germany, mainly of raw materials, have especially increased of late.

*Wheat market.* — It will be remembered that the various taxes on wheat producers apply to Algeria as well as to the home country.

The measures dealing with the coefficient of extraction of flour, referred to in the Chronicle for France, are similarly applicable also to Algeria.

The minimum percentage of hard wheat from North Africa which the industries of the home country are obliged to use in the production of food pastes, semolina and similar products has been fixed at 80 per cent. as from February 20, 1939 <sup>(1)</sup> and at 95 per cent. as from April 1 <sup>(2)</sup>.

*Export of cattle from Morocco.* — The home country has allowed the import into France and Algeria <sup>(3)</sup> of a supplementary quota of 7,000 cattle from the French zone of Morocco.

*Wine market.* — The measures for the holding back and the distillation of wine mentioned in the Chronicle for France apply also to Algeria. Similar measures have been taken in Morocco.

*Farm leases and mortgage interest rates.* — During the depression in the summer of 1935, decree-laws to decrease agricultural costs had reduced ground rents and the interest charges on mortgage debts by 10 per cent., these measures applying to Tunis as well as to France. Since then the position of the agricultural classes has radically changed, so that these decrees for reducing ground rents and mortgage debts have been abrogated in Tunis as they already were in France.

## French West Africa and Togoland.

*General price policy.* — The policy of price control has been relaxed in French West Africa. Nevertheless the rule requiring the previous consent of the price control committees for rises in prices still holds for certain goods, including various foodstuffs and some commodities necessary for agricultural production such as manures, agricultural machinery and building materials <sup>(4)</sup>.

*Native saving societies.* — In French Togoland saving societies which are quite a new feature among the natives, going back no further than 1937, have been growing rapidly. At the end of 1938 there were already nine societies with 200,000 members.

## French Equatorial Africa and the Cameroons.

*Customs tariff.* — The rates of the customs duties levied on foreign goods entering that part of Gabon which is not included within the Conventional Basin of the Congo have been raised by 7 per cent. <sup>(5)</sup>.

<sup>(1)</sup> *Journal Officiel*, February 17, 1939. — <sup>(2)</sup> *Journal Officiel*, March 29, 1939. — <sup>(3)</sup> *Journal Officiel*, February 7, 1939. — <sup>(4)</sup> *Journal Officiel de l'Afrique occidentale française*, January 7, 1939. —

<sup>(5)</sup> *Journal Officiel*, January 29, 1939.

*Improvement of cultivation.* — A Decree of January 17, 1939 <sup>(1)</sup> authorises the French Commissioner for the Cameroons to take all measures necessary for the improvement and the protection of crops and live stock in the territories under his authority.

### Madagascar.

The colony of Madagascar is henceforth to be self-sufficing as regards the production of sugar. The sugar producers of Madagascar were parties to the agreement of March 1938 concluded between the sugar-producers of the home country and of the French colonies. By this agreement the sugar producers of the home country and of the other colonies had promised not to encroach upon the home market of Madagascar, which was furthermore granted export quotas to the home country and to Algeria. In addition, as from the end of 1938 the importation into Madagascar of sugar of foreign origin was to be prohibited <sup>(2)</sup>.

The cultivation of coffee is developing rapidly in the island. In recent years many coffee trees have been planted, and the area actually yielding coffee rose from about 84,000 hectares in 1937 to about 90,000 hectares in 1938. Rice cultivation is also progressing, and in order to aid this development great irrigation works are being carried out. Rice exports from Madagascar have been increasing and imports falling off; the exports mainly go to France and consist of superior quality rice for human consumption.

### Indo-China.

The year 1938 has ended in Indo-China with economic and financial conditions generally very favourable.

The total exports of Indo-China for 1938 exceeded 60,000 tons, as against 45,000 tons in 1937. In 1938 in the single month of December, always a good month for exports, these exceeded 10,000 tons.

The index of wholesale prices of the products of the colony (base 1925 = 100) fell in the later months of 1938, from 106 in September to 98 in December; whilst the general index of wholesale prices (also base 1925 = 100) fell from 121 to 117 over the same period.

However, the only real cause for anxiety at the end of the year lay in the reduction of rice exports and the recent fall in prices of this cereal, which began in October 1938 and became more rapid in November and December. Prices of rice No. 1 at Saigon had fallen by 30 per cent. by December 31, 1938 as compared with those prevailing at the end of September; and between the end of October and the end of December paddy prices weakened by 40 per cent. Maize prices have kept much firmer, having been 8.1 piastres the quintal in October 1938, weakening to 7.8 piastres in November, and recovering to 8.5 in December.

*Trade Agreement with Siam.* — France has concluded a commercial agreement with Siam regarding Indo-China. This agreement is for a period of five years, renewable by tacit consent.

*Rubber.* — A Decree of January 18, 1939 <sup>(3)</sup> provides for the application to French Indo-China of the new rules recommended by the International Committee for Rubber Control in its resolution of March 29, 1938.

<sup>(1)</sup> *Journal Officiel*, January 25, 1939. — <sup>(2)</sup> *Journal Officiel*, December 27, 1938. — <sup>(3)</sup> *Journal Officiel*, January 21, 1939.

Consequently the area of rubber plantations in Indo-China by December 31, 1930 must not exceed by more than 5 per cent. the area already planted. The poor qualities of rubber used to be taxed on export from Indo-China as heavily as the rubber of higher value; hence in order to apply the tax on rubber exports more fairly the tax on the poor qualities has been reduced by 4 per cent. <sup>(1)</sup>.

*Land system.* — The Decree of July 21, 1925 effected the unification of the legal status of immovable property in Cochinchina as well as the adoption of the principle of the land register. The Decree provided for the progressive application of the new legislation to all the territories of the Indo-Chinese Federation; this has already taken effect in the French territories of Tourane, Hanoi and Haiphong. The work of surveying is already well advanced, and hence it was thought that the time had come for the application of the land legislation to the whole territory of Tonkin. In that territory landed property was governed by legislation which varied according to the personal status of the holder of the property right, which was not a convenient system. On March 29, 1939 a Decree <sup>(2)</sup> was issued to apply to immovable property lying within the protected territory of Tonkin and subject to French law. At the same time a legislative act of the protected sovereign applies the same rules to immovable property subject to Annamite law. This simultaneous promulgation of the two texts makes possible in Tonkin, as in Cochinchina, the attainment of a unified legal system for immovable property. Nevertheless Succession is still governed, even as regards immovable property, by the legal status of the individuals concerned, both as regards the form and the object of wills and the status of the heirs and legatees and as regards the devolution of goods and the method of regulating division of the property. But the rights devolving to the various heirs called upon to take up a succession as regards immovable property dependent upon it can only be of the type defined in the above-mentioned texts, that is to say: property, usufruct, use and habitation, long lease, the servitudes and two sureties which creditors may possess on the immovable property of debtors, lien on immovables and mortgage.

The principle of the land register applies to the whole of Tonkin. A landed property service has been set up, responsible for keeping the registers and for carrying out the prescribed formalities for the publication of rights to real property.

### WORLD SUPPLY OF FATS AND OILS <sup>(1)</sup>

SUMMARY: I. General tendencies of the world trade in fats, oils and oil-yielding raw materials *Developments up to 1914; developments from the War to the beginning of the World Economic Crisis; developments since the beginning of the World Economic Crisis.* — II. Vegetable oils and oil-yielding raw materials: *Volume of output; importance of different oilseeds, world distribution of production; international trade.* — III. Butter. — IV. Pig and beef fats. — V. Marine animal oils: *Production; international trade utilization of these fats and oils.* — VI. The principal importing countries of fats and oils. — VII. Utilization of fats and oils: *Developments in general; consumption of food fats; production of margarine and other artificial food fats.*

#### I. — General tendencies of the world trade in fats, oils and the oil-yielding raw materials.

##### Developments up to 1914.

The growth of the present world market for fats, oils and the oil-yielding raw materials, which began in the middle of the last century, was due to the development of a large import area in North-West Europe. The industrial countries of Europe, in spite of increases in their own output of animal fats such as butter, lard and salted fat pork, and the expansion of their cultivation of oilseeds such as rape, flax, and poppy, became less and less able to supply their rapidly increasing requirements of fats and oils for industrial and food purposes. Up to this time international trade in fats and oils had been confined almost entirely to animal fats and olive oil; but now it began to include many different oils and oil-yielding raw materials coming from the most distant countries.

---

(1) The Institute recently published a study in two volumes on the production and international trade in fats and oils. The first volume dealt with vegetable oils and fats, the second with butter, pig and beef fats, marine animal fats, the consumption of oils and fats in the importing countries of most importance for the world market, the utilization of oils and fats and the movements of prices. The two volumes appear as Nos. 4 and 5 of the series of publications on the principal agricultural products on the world market, and have appeared in French under the title: *La Production et le Commerce International des Huiles et des Graisses*, and in English under the title *Oils and Fats: Production and International Trade*.

The figures contained in this article have largely been taken from this work. For further details the reader is referred to the work itself and to the regular statistical publications of the Institute (*Monthly Crop Report and Agricultural Statistics* and the *International Yearbook of Agricultural Statistics*).

Even in the first decade of the last century England was being supplied with palm oil from West Africa, coconut oil from Ceylon and sesame and groundnut oil from India. But the supply of oils to Europe from the overseas countries only became of real importance when international trade in manufactured oils was replaced by the trade in their raw materials.

British India was the first great area to export vegetable oil-yielding raw materials such as rapeseed, linseed, sesame seed and groundnut. In the 'fifties the first supplies of copra arrived from the Malay States, East Africa, Ceylon and British India, and of groundnut and palm kernel, as well as palm oil, from West Africa.

The output of oil-yielding raw materials continued to expand both in Western Europe and overseas until about the 'eighties. A fundamental change then began. The cultivation of oilseeds in Western Europe was no longer able to meet the competition of imported oilseeds, and further, as the result of a shift in Western European agriculture to animal husbandry with a view to producing fresh milk, butter and meat, it became more profitable to cultivate root-crops and fodder than oilseeds with their falling prices. The production of oil-yielding raw materials shifted to Eastern and South-Eastern Europe, and especially overseas, which areas were economically, and perhaps climatically, more suitable for their production. The United States, soon followed by other countries, continually expanded its use of cottonseed in the production of oil, which had first been carried on on industrial scale at the end of the 'sixties. In 1867 there were only 4 cottonseed oil mills in the United States; by 1880 the figure had risen to 45, and by 1890 to 119. The output of cottonseed oil rose from 11,340 metric tons (25 million pounds) in 1874-75 to 139,250 metric tons (307 million pounds) in 1890-91 and 328,850 metric tons (725 million pounds) in 1901. Part of this output was exported, but far the greater part was manufactured into lard compound, and in this way large quantities of lard were released for export.

The rapid increase in the output of copra in the Netherlands Indies and the increased exports of groundnut from British India as a result of the cultivation of types with a high yield were also of great importance. Shortly before the turn of the century China began to export sesame seed, cottonseed, rapeseed and groundnut.

Agriculture in Western Europe shifted mainly to the production of butter, which received considerable impetus from the increasing employment of oilcake, hitherto used chiefly as a fertilizer, for fodder. Oilcake was once much more important from the point of view of nutrition than the oil obtained from it, which was used chiefly for industrial purposes. Except for olive oil, the importance of vegetable oils for food purposes declined in Western Europe, butter, lard and salted fat pork remaining the principal food fats.

Butter was produced in greatly increasing quantities, especially in North-Western Europe, while large quantities of lard and salted fat pork were supplied by the United States. Exports of butter from Denmark and the Netherlands increased from year to year. Besides butter, lard and salted fat pork, another product, margarine, was used in increasing quantities. Margarine was at first manufactured almost entirely from animal fat, of which, again, the United States was the principal supplier.

At the turn of the century this movement became more rapid. The industrial population of Europe further increased in numbers and raised its standard of living, so that the production of animal fats could not keep pace with the increasing demand. Exports of butter from Denmark, the Netherlands, and soon also from Australia and New Zealand increased still further. In Western Europe on the other hand, where pig-rearing was more and more directed to the production of meat, the output of pig fat fell off. In the United States also exports of lard had passed their maximum. Thus the margarine industry discovered market possibilities which it had before scarcely expected, and production leaped up. This was made possible chiefly through progress in the manufacture of vegetable oils, which enabled the margarine industry to use these oils in increasing quantities. The margarine industry became one of the most important consumers of vegetable fats and oils. Thus in 1913 the German and Netherlands margarine industries used about fifty per cent. vegetable fats and oils. Nevertheless vegetable oils were still mainly produced for industrial proposes.

In this period not only new areas of production but also new oil-yielding raw materials appeared on the world market. The utilization of oil plants growing wild lost importance as against their planned cultivation. Exports from China increased rapidly after the turn of the century. In 1900 Argentina appeared as another supplier of oil-yielding raw materials, and her exports of linseed soon challenged the position of Russia, who had hitherto been the chief exporter of this product. In 1908 the first supplies of soya bean reached Europe, and within a few years this became one of the most important oil-yielding raw materials on the world market.

The following figures show the expansion in the sales of oil-yielding raw materials. The import surplus of oil-yielding raw materials for the United Kingdom rose from about 770,000 metric tons in 1909 to over 1,500,000 metric tons in 1913; that of Germany from about 600,000 to more than 1,700,000 metric tons; that of France from 640,000 to about 1,000,000, and that of the Netherlands from 140,000 to about 400,000 metric tons.

### **Developments from the War to the beginning of the World Economic Crisis.**

During the War the tendencies mentioned above were interrupted, but soon after they appeared again as strong as ever, so that within a few years the consumption of fats and oils for food purposes in different countries even exceeded the pre-War level. The increased consumption was met first by the growing production and use of vegetable oils, principally tropical, the increased output of butter and later, by the use of large quantities of whale-oil in the margarine industry.

The production of oil raw materials was expanded through more intensive cultivation and an extension of the area under oil-yielding crops in the original countries of production, the bringing into cultivation of new areas, and the cultivation of new oil-yielding raw materials. The trends of prices and output were also much affected by the great progress in the manufacture of oils, especially in hardening, through which the hard, oils, coconut and palm kernel

oil, lost their special position. For example, the progress in production and manufacture fundamentally changed the significance of groundnut oil, which had hitherto been used only in limited quantities for food purposes, and of soya bean oil, which had been used entirely for technical purposes. The margarine and artificial fat industry ultimately came to use only small quantities of fats and oils from land animals. On the other hand these industries also employed, amongst their raw materials, whale-oil, the production of which increased rapidly after the extension of whaling to the Antarctic.

The importance ultimately acquired by margarine production for the supply of food fats can be seen from the fact that in 1929 the production of margarine in Europe was estimated at over 1.1 million metric tons, compared with a butter output in Germany, which has the largest output in Europe, of 350,000 metric tons in the same year, in Denmark, the principal butter exporting country, of 179,000 metric tons, in the Netherlands of 86,000 metric tons, in Switzerland of 15,700 metric tons and in the whole of Europe (excluding Russia) of about 1.4 million metric tons.

Vegetable oils and fats had by then come to be used chiefly for purposes of nutrition; technical improvements meanwhile were enabling industry to reduce its requirements of fatty oils, and replace them by other raw materials.

TABLE I. — *The Supply of Oilcake in certain countries.*

(Thousand metric tons).

Year	United Kingdom	Germany	Denmark	France	Netherlands
Average 1909-13 . . .	1,297	1,391	( <sup>1</sup> ) 680	344	—
Average 1924-28 . . .	1,415	1,160	921	( <sup>2</sup> ) 411	( <sup>2</sup> ) 661
1929 . . . . .	1,433	1,785	1,130	505	801
1930 . . . . .	1,224	1,511	910	404	510
1931 . . . . .	1,302	1,871	902	517	651
1932 . . . . .	1,285	2,296	639	580	573
1933 . . . . .	1,235	2,051	660	673	662
1934 . . . . .	1,456	1,581	691	633	651
1935 . . . . .	1,648	1,226	765	541	560
1936 . . . . .	1,545	1,158	863	740	578

(<sup>1</sup>) Average 1910-14. — (<sup>2</sup>) Average 1925-28.

The importance of oil-yielding raw materials for food had also increased indirectly. The use of oilcakes for fodder purposes assumed immense proportions, not least on account of the favourable relationship of their prices to those of other fodders; in fact in many countries a kilogramme of protein in oilcake cost less than half or even less than a third of that in other fodders. Without oilcake the large yields of milk and meat of the highly developed animal husbandry in Europe were now inconceivable. The increased use of oilcake for fodder affected indirectly the productiveness of the soil as a result of the increased supplies of

valuable manure, a factor the importance of which should not be underestimated; the areas using large quantities of oilcake for fodder took first place for arable farming in all countries. The strong demand for oilcake led to a temporary preference for oil-yielding raw materials leaving large residues from their manufacture. For this reason among others the soya bean, with an oil yield of 15 per cent., against copra's 60 per cent., was increasingly used.

In this period three new large consumers of oil-yielding raw materials appeared on the world market: the United States, Italy and Japan. Tropical and sub-tropical oils, as a result of their low cost of production, not only competed with olive oil on the world market, but penetrated, as in the case of Italy, into the producing areas. In the United States the use of oilcake for fodder showed a very substantial increase. Besides oil-yielding raw material Japan imported large quantities of oilcake for fertilizer from East Asia.

### Developments since the beginning of the World Economic Crisis.

Thus, in every field of fat and oil production, there were great increases in output, stimulated by favourable prices and technical progress. Even without the general economic crisis a reaction was bound to follow; but, as a result of the crisis, it came in an exceptionally sharp form.

Up to 1928 fat and oil prices had been good despite the increasing supply. But in the next few years, while production continued to increase, and at a rapid rate, the fall in consumption extended further and further and included more and more countries as the crisis spread. Prices of oils and fats also started to fall, beginning with those of the products of the tropical and semi-tropical areas. As a consequence there was great competition to sell, in which tropical products and those of purely agricultural export areas were in much the stronger position; for not only did they have the advantages of greater productivity, but they also enjoyed lower labour costs per unit of production.

European agriculture, and especially that of the importing countries of the Continent, saw their herds of milch cows and pigs as well as their olive growing threatened, and they demanded protection against this overseas competition. Consequently in many countries the tariffs were raised or other measures such as the institution of quotas were taken in order to limit imports, and in 1933 and 1934 several countries proceeded to an extensive regulation of their fat and oil market.

The severe nature of the measures taken in the different countries was, however, undoubtedly due to the influence of good fodder harvests, which had affected the output of butter and pig fat very favourably. With the economic recovery and the less favourable harvests these restrictions appeared undesirably strict, and the excessive supply of previous years was followed in 1935 by a temporary shortage. Instead, however, of taking steps to increase their imports, these countries were compelled, or preferred, to use all means to increase their home output. Their aim was to be as independent as possible of foreign supplies of fats. Not only the European countries, but the United States too was unwilling to allow the continuance of the partial shift of their fat supply to im-

\* *Ec. 6' Intl.*

ports from distant countries, which had been developing in recent decades. A partial change in the direction of international trade, parallel with these attempts at greater self-sufficiency in fats and oils, took place with regard to butter, lard and other animal fats and also to vegetable oils and fats, owing to transfer difficulties and bi-lateral agreements.

The attempts to become more independent of foreign countries also extended to cover fodder supplies, so that oilcake tended to be partially replaced by home-produced fodders.

Though the shifts in the production and consumption of fats and oils have greatly influenced international trade in recent decades, they have only been able slightly to modify the highly developed international division of labour in the production of fats and oils. The increased economic activity in recent years has itself shown that while there are still many unused possibilities in most of the importing countries, the limits of self-sufficiency in fats and oils can only be extended with very great difficulty; and the prospects of international trade are much better in this field than as regards most other agricultural products.

## II. — Vegetable oils and oil-yielding raw materials.

### Volume of output.

The output of vegetable oil and oilcake has more than trebled since the beginning of the century and has about doubled since 1913. During the crisis production remained more or less at the same level, only the further rise being interrupted. With the economic recovery, an increase in production began in 1935 which has been maintained until now. The output of important vegetable oils covered by statistics is computed at 11.2 million metric tons for 1937, against 5.9 million for the five years 1909-1913 (see Table 2).

### Importance of different oilseeds.

As Table 2 shows, the development of the output of the different oilseeds has varied greatly. Tropical and sub-tropical production shows the largest increases, and this is easily explained by the great differences in conditions of production and costs. The output of linseed, on the other hand, only rose a little, while that of rapeseed and hempseed actually fell off.

### World distribution of production.

Corresponding to these movements of the different crops, the share of the separate world regions in total production has altered considerably. The following figures show the distribution of total production.

Region	Average 1909-13		Average 1935-37	
	In 1000 metric tons of oil	In per cent.	In 1000 metric tons of oil	In per cent.
Europe . . . . .	691.4	11.8	1,115.7	10.7

(<sup>1</sup>) The volume of each of the oilseeds is converted into oil by using the coefficient of its average yield. Owing to the lack of data on production, in compiling this table the figures for exports have been used in certain cases such as China (which is particularly important, as she only exports a small part of her output of oilseeds), Brazil for castor oil, Manchukuo for perilla (exports in these two cases representing by far the larger part of output) and quite generally for palm oil and copra.

## International trade in vegetable oils and oil-yielding raw materials.

Table 3 shows the export of oil-yielding raw materials and vegetable oils from the principal *exporting countries*. Nearly all the great exporting countries supply the world with a wide range of products, but nevertheless specialize on a few products which make up the bulk of their exports. The following list shows the vegetable oils chiefly exported by the more important producing areas:

<i>Netherlands Indies</i> .....	Copra and palm oil
<i>Argentina</i> .....	Linseed
<i>Manchukuo</i> .....	Soya bean, soya oil and groundnut
<i>Nigeria</i> .....	Palm oil, palm kernel and groundnut
<i>Philippines</i> .....	Copra and coconut oil
<i>British India</i> .....	Linseed, rapeseed, groundnut, sesame seed, sesame oil, castor seed, castor oil
<i>French West Africa</i> .....	Groundnut, palm kernel, palm oil
<i>China</i> .....	Tung oil, groundnut, groundnut oil, sesame oil, sesame seed, rapeseed
<i>British Malaya</i> .....	Copra, coconut oil, palm oil
<i>Brazil</i> .....	Castor seed, cottonseed, cottonseed oil, babassu, Brazil nut
<i>Belgian Congo</i> .....	Palm oil, palm kernel
<i>Gambia</i> .....	Groundnut
<i>Egypt</i> .....	Cottonseed, cottonseed oil.

(1) The figures in this table include foreign trade in the products listed in Table 2. Trade listed in the foreign trade statistics of separate countries under the heading "other" or "various oils and fats", however, is only included to the extent that further details were given. — (2) Average 1932-33.

The principal *importing areas* are, as Table 4 shows, Europe and North and Central America. In 1937 the net imports of these two regions amounted to about 3.7 million metric tons (average 1909-13 = 1.6 million metric tons), of which about 2.5 million metric tons went to Europe. Europe's own production covered only about 30 per cent. of her needs, and apart from temporary fluctuations, mainly due to the strong influence of weather conditions on the output of olive oil, this percentage has only slightly altered during recent decades, as Europe has generally been in a position to increase her production in the same ratio as her consumption. The largest net imports into Europe occurred in the last few years. In 1937 the import surplus of oil raw materials converted into oil was 2,526,000 metric tons, as against an average of 1,525,800 metric tons for the five years 1909-13. The increase of imports into Central and North America was even greater, the larger part of which, of course, went to the United States. The import surplus of North and Central America rose from an average of 37,100 metric tons for the years 1909-13 to 1,203,000 metric tons in 1937.

<sup>(1)</sup> The figures in this table include foreign trade in the products listed in Table 2. Trade listed in the foreign trade statistics of separate countries under the heading "other" or "various oils and fats", however, is only included to the extent that further details were given. — <sup>(2)</sup> Export surplus.

## III. — Butter.

Table 5 shows the trend of butter production in the countries important from the standpoint of world trade. The figures given are, however, only approximate. In many countries factory production is computed fairly accurately, but the material for estimating the production on farms is everywhere rather inadequate. These difficulties lead many countries to limit their production statistics to factory output. In considering the development of this production, therefore, it should not be forgotten that there is a tendency in most countries to increase factory production at the expense of farm production. Thus an increase in the factory output cannot simply be considered equivalent to an increase in the total output of butter.

As the figures show, production has increased greatly in recent decades. From 1925 to 1936 output in the countries treated in the table rose from 2.54 million metric tons to 3.34 million metric tons. The increase in output was particularly marked in Europe, rising from 1.1 to 1.57 million metric tons. This increase was partly due to the increase in the cow population, but much more to the rise in milk yields resulting from improvements in breeding and rearing.

The international trade in butter (see Table 5) has steadily expanded in the last two decades. Of the exporting countries those in Australasia took the greatest share in this increase. Exports from Denmark in the last few years have remained at about the same level as the average for the five years 1924-1928. At the same time the Netherlands, the second most important exporting country in Europe, was able to expand her exports. Exports from Sweden, Latvia, Lithuania, Estonia and Poland have all shown considerable increases in recent years. On the other hand, exports from Argentina have been well below the average for the years 1924-28. The leading exporting country was throughout Denmark with the exception of 1935, in which year the exports from New Zealand exceeded those from Denmark, while in the two following years they remained only a little behind.

The *United Kingdom* easily takes first place among the importing countries. As a result of the numerous obstacles and limitations on imports in the other importing countries her share in total world imports rose from 64.7 per cent. in 1909-13 and 62.2 per cent. in 1924-28 to 67.1 per cent. in 1929-33 and finally to almost 80 per cent. in the years from 1934 to 1936.

Apart from the *United Kingdom*, *Germany* is the only country which still imports large quantities of butter. In 1929 imports into Germany reached 135,500 metric tons, a figure higher than any previously attained. In the following years these imports fell off continually, amounting to only 59,144 metric tons in 1933, but since 1934 they have been steadily increasing again, reaching 92,290 metric tons in 1938.

Of the other European countries, the *Belgo-Luxemburg Union*, *France* and *Switzerland* have reduced their imports to small quantities. In fact since 1935 *France* has had a butter surplus, though this has been small, amounting

in 1937 to 2,329 metric tons and in 1938 to 2,314 metric tons. The largest importers after Germany are now the Netherlands Indies (imports in 1938 = 4,330 metric tons), British India (3,118 metric tons) and British Malaya (2,128 metric tons (<sup>1</sup>)).

#### IV. — Pig and beef fats.

The production and sale and particularly the international trade in these fats has suffered exceptionally from the competition of vegetable and marine animal fats.

The *United States* is the leading lard-producing country in the world. In 1923-24 her production reached the record figure of 1,270,000 metric tons. This

(<sup>1</sup>) See also Butter Production, Trade and Prices in 1938 in *Monthly Crop Reports and Agricultural Statistics*, April 1939.

<sup>(1)</sup> Belgium-Luxemburg, Netherlands, Austria, Switzerland, France, Italy, Poland. —<sup>(2)</sup> 1925-28.

was followed by a decline, due at first to marketing difficulties, and after 1933 to Government measures and drought. In 1933, however, output still amounted to 1,109,000 metric tons, but by 1935 it had fallen to 575,000, rising again to 759,000 tons for 1934, but falling back to 650,000 tons for 1937. For decades a substantial part of this output had been exported, in the last five years before the War and in the 1924-29 period about a third. However, for the reasons mentioned above, exports fell from their average of over 350,000 [metric tons for the five years 1924-28; in 1933 they were still 265,000 tons, but by 1935 this figure had dropped to 150,000 tons.

This decline in exports from the United States was in part favourable to other exporting countries such as Denmark, the Netherlands, Hungary, Yugoslavia, Canada, Brazil and China. Nevertheless, the increase in exports from these countries was small compared with the reduction in exports from the United States, so that total exports from the principal exporting countries of Europe, North and South America and Asia fell from an average of 406,000 metric tons for the five years 1924-28 to about 134,000 metric tons in 1936.

The data relating to the production of beef fats is very incomplete. The principal exporting countries are Argentina, Australia, New Zealand, Uruguay and the United States. Exports go mainly to the United Kingdom, Germany and Czechoslovakia. In recent years the United States has also become a net importer. International trade in this commodity has greatly declined now that the margarine industry is no longer dependent on these animal fats.

## V. — Marine animal oils.

### Production.

A distinction must be made between fish oils, fish liver oils, and oils from whales and other marine mammals. Only for the world production of whale-oil, which, however, makes up about two-thirds of the total output of marine animal oil, is there reliable information. This is contained in the International Whaling

Statistics published by the Norwegian Government, on mandate from the *Whaling Committee of the International Council for the Study of the Sea*.

About 90 per cent. of the production of whale-oil in recent years has come from the Antarctic, the supply of whales in the Arctic having been seriously reduced by reckless whaling in the past.

In 1930-31 the output of whale-oil rose to 624,400 metric tons. At the same time the economic crisis had led to a great increase in stocks, and Norway, which produced over 60 per cent. of the total output, decided not to take part in the next whaling season. As a result, production in 1931-32 fell to 155,100 metric tons. In the next two years output was respectively 438,000 and 436,000 metric tons. These quantities could, however, only be marketed with difficulty, and the price of whale-oil, (No. 0-1) per English ton fell to £8 10s—£11 10s, against £34—£38 in 1925, £40—£90 in 1920 and £21 10s—£22 10s in 1913. This fall in prices, combined with anxiety about the decimation of whale supplies, led to agreements on the regulation and restriction of whaling, first between Norway and Great Britain, which in 1934-35 together accounted for about 94 per cent. of the total production, in approximately equal proportions, and in more recent years between all countries taking part in whaling.

TABLE 9. — *Output of Whale-Oil.*

(Thousand metric tons).

1909-10 . . . . .	48.1	1932-33 . . . . .	439.7
1912-13 . . . . .	129.8	1933-34 . . . . .	435.7
1929-30 . . . . .	474.0	1934-35 . . . . .	455.7
1930-31 . . . . .	624.4	1935-36 . . . . .	486.2
1931-32 . . . . .	155.1	1936-37 . . . . .	543.7

The conclusion of a comprehensive international agreement was necessary, because, besides Norway and Great Britain, other countries were increasing the extent of their whaling operations — Japan and the United States from 1935-36 and Germany from 1936-37. The particular regulations of the London Agreement may still be imperfect, but nevertheless limits are set to any sharp increase in production.

The principal producers of liver oils and other fish oils are the United States, Norway, Japan and Great Britain. In 1936 the United States output amounted to about 8,000 metric tons of liver oil and 121,000 metric tons of other fish oils. By far the larger part of Norway's output is exported, and in 1936 exports (there are no figures for production) amounted to 10,939 metric tons of medicinal oils, 11,767 metric tons of herring oils and 18,686 metric tons of other fish oils. In the same year exports from Japan were 36,666 metric tons. According to the data supplied by the 1934 Census of Production, Great Britain produced in that year 20,000 metric tons.

#### International trade.

Table 10 shows the movement of the international trade in marine animal oils. The big disparity between the total net imports and exports is due to the circumstance that a large part, principally the output of whale-oil, is transported

*Germany* is the largest consumer of marine oils. In the last two decades total consumption, in conjunction with the increase in the output of margarine, rose continuously. According to existing data in 1933, 153,000 metric tons were used in the margarine industry and 1,500 metric tons in the soap industry. A comparison of these figures with those of imports will show that only small quantities of whale-oil could have been at the disposal of other branches of production during the years in question.

In *Great Britain*, which is the second most important consuming country of whale-oil, this product is mainly used in the margarine and lard-compound industries. Thus in 1936, 66,000 metric tons were used in the margarine industry, 41,000 metric tons in the lard-compound industry, and 28,000 metric tons in the soap industry. Calculating on the basis of the import figures, therefore, only small quantities were free for other purposes.

In contrast to Germany and the United Kingdom, the *United States* uses the largest part of its whale-oil and other marine fats in the soap industry, about 90 per cent. of the whale-oil and more than half the fish oil being used for this purpose from 1932 to 1936. The margarine industry did not use any marine fats and the lard compound industry only about 1 per cent. of all fats and oils used.

## VI. — Principal importing countries of oils and fats.

In recent years the principal importing countries, in order of the volume of their import surpluses, have been the United States, Germany, the United Kingdom, France and Italy; whilst the Netherlands, Denmark, and Czechoslovakia have also had substantial import surpluses.

Table II shows the total consumption and either the import surplus or the home output of oils and fats in the three principal importing countries. The calculation of the import surplus is based on the figures for actual imports and exports. The import surplus calculated in this way may differ substantially from the "real" import surplus, i. e. from the quantity obtained by including in the above imports the quantity of fat (e. g.; butter and pigfat) which is acquired through imports of fodders.

Up to 1915 the *United States* had for decades had a considerable export surplus of oils and fats which still in 1914 amounted to 238,000 metric tons. Since 1915, however, only in two years, 1921 and 1924, have there been export surpluses. The output of pig and beef fats, primarily of lard, continued to be considerably in excess of home requirements, while the output of butter was at least sufficient. Imports of oilseed and vegetable oils, however, increased from year to year. After 1923 the export surplus of animal fats showed a tendency to fall, moving from 544,300 metric tons in 1923 to 388,000 metric tons in 1934. In 1935 and 1936 imports of animal fats exceeded exports for the first time. There were big increases in imports of tallow and marine oil, while exports of lard and tallow fell to small amounts compared with earlier periods. As at the same time imports of oilseeds and vegetable oils were increasing still further, the total import surplus of oils and fats reached 1,076,000 metric tons in 1935, the figure

for 1936, however, falling to 927,000 metric tons. The highest import surplus yet reached occurred in 1937 with 1,142,000 metric tons. The big increase in imports was partly due to the reduction in the home output, resulting from unfavourable weather conditions and measures of restriction, and partly to increasing consumption. The increase in imports related primarily to linseed, palm kernel, palm oil, cottonseed oil, marine oils and coconut oil.

TABLE II. — *Supply of Oils and Fats in the United States, Germany and the United Kingdom* <sup>(1)</sup>.

(Thousand metric tons).

Year	United States		Germany		United Kingdom	
	Total consumption	Import surplus	Total consumption	Imports surplus	Total consumption	Home production
Average 1909-13 . . . . .	( <sup>1</sup> ) 2,696	( <sup>2</sup> )( <sup>3</sup> )(-238)	1,754	711	950	125-200 thousand metric tons per annum.
Average 1924-28 . . . . .	3,642	198	—	—	1,104	
1929 . . . . .	3,993	485	2,041	1,067	1,200	
1930 . . . . .	3,835	418	2,077	1,073	1,200	
1931 . . . . .	3,813	396	2,081	1,037	1,225	
1932 . . . . .	3,667	229	2,201	1,173	1,235	
1933 . . . . .	3,724	437	2,078	1,015	1,275	
1934 . . . . .	3,944	390	2,109	1,008	1,300	
1935 . . . . .	3,963	1,076	2,002	872	1,300	
1936 . . . . .	4,173	927	2,152	989	1,330	
1937 . . . . .	34,232	1,142	...	976	...	

(<sup>1</sup>) In comparing the figures for the three countries with one another, it is to be noted that the calculation of the quantities has not been based on the same principles in each case. Thus in the case of Germany and the United Kingdom only the real fat content of animal fats is included; while in contrast to those for the United Kingdom and the United States the German figures include the fat content of milk, cheese and salted fat pork. In order to reproduce the figures in the form in which they were supplied by each country, no attempt has been made to standardize them. — (<sup>2</sup>) 1914. —

(<sup>3</sup>) Export surplus.

In the three years 1935-37 about 25 per cent. of the consumption of oils and fats in the United States was met by imports: Measures of the most varied description were introduced to lessen this dependence on foreign countries.

The good cotton crop in 1937 and the increase in the production of lard in 1938 led to a fall in net imports to 693,100 metric tons in 1938, while the total consumption of 4,192,100 metric tons remained about the same as in 1937 (4,232,000 metric tons).

Until 1933, when Germany introduced a thoroughgoing control of the fat market aiming at the greatest possible self-sufficiency, her import requirements were considerably higher than in the five years 1909-13. The share of imports in total consumption rose from 41 per cent. in 1909-13 to 53 per cent. in 1932, but in the following year it started to move back towards the 1909-13 position.

The increased share of the home production is the more worthy of note because of the greatly increased consumption during the same period, consequent on improved earning possibilities. If account is taken of fats obtained through the importation of fodders, the dependence on abroad was about 60 per cent. in the five years 1909-13, 65 per cent. in 1928 and fell in subsequent years to 50 per cent. in 1935 and 1936.

As in the United States and Germany, the consumption of fats in the *United Kingdom* has also shown a large increase. The dependence on abroad has altered little, only 10 to 15 per cent. of the consumption being produced at home.

*France* is also largely dependent on outside sources for her supplies of fats and oils, but in this case the dependence is mainly on her own colonies. The following figures relate to the supply of fats and oils in France for 1935:

	Total oil and fat supply	Home production
	(Thousand metric tons)	
(1) Vegetable oils and fats . . . . .	511.2	17.8
(2) Butter . . . . .	210.4	215.0
(3) Lard and tallow . . . . .	57.0	75.0
(4) Marine oils and fats . . . . .	6.7	0
Total . . .	<u>785.3</u>	<u>307.8</u>

Thus the share of imports in the total supply was about 60 per cent.

The available data suggest a total consumption of food fats in *Italy* in the last few years of about 500,000 metric tons, 90 per cent. of which was produced at home. According to these estimates some 160,000 metric tons were used for industrial purposes, of which from 25,000 to 37,000 metric tons were supplied by home sources. The following table shows the figures in detail:

	Total consumption of oils and fats	Home production
	(Thousand metric tons)	
(1) <i>Food oils and fats:—</i>		
Olive oils . . . . .	220.0	210.0
Seed oils . . . . .	63.0	6.3
Salted pork fat and lard . . . . .	166.0	165.7
Butter . . . . .	52.5	52.0
Total . . .	<u>501.5</u>	<u>434.0</u>
(2) <i>Industrial oils and fats:—</i>		
Animal and vegetable oils and fats . . . . .	160.0	25.0-37.0
Total consumption of oils and fats . . . . .	<u>661.5</u>	<u>459.0-471.0</u>

## VII. — Utilization of fats and oils.

### Development in general.

Some fats are suitable for food as soon as obtained, requiring no further processing and, as with butter and lard, are used almost exclusively for human consumption. The same is true of a number of vegetable oils which, after being pressed in the cold, only require filtering to be suitable for food. Vegetable oils obtained otherwise are, however, also gradually being made suitable for purposes of human consumption. Before the War, for example, all oils extracted by solvent were still considered to be suitable only for technical uses. It was only with the introduction of new refining methods by which free fatty acids, colouring substances and odours could be completely eliminated, that it became practical to obtain from extracted oils good, and in some cases, excellent edible oils. A similar development may be noted in the case of whale-oils, due primarily to progress in methods of hardening fats. This material, like many other oils and fats previously unsuitable for food, only enters indirectly into consumption, namely, after being manufactured into the so-called artificial edible fats such as margarine, lard compound, etc.

As a result of the great progress in oil production and oil processing, not only are nearly all kinds of oils, with a few exceptions (tung, castor, croton oil, and some others of less importance), suited for human consumption, but also a higher return can be obtained from various oil-yielding raw materials, and also in the case of many oils the percentage of the product suitable for human consumption has been raised. Whereas, for example in Italy 30 years ago about one-third of the output of olive oil could be used only for industrial purposes, with present day refining methods some 95 per cent. is suitable for human consumption.

In the last few decades the increase in the consumption of oils and fats has related almost entirely to their use for food purposes. The proportion of food fats to total consumption of fats and oils has, in fact, constantly increased. Thus of the total consumption of oils and fats in Germany over the period 1930-35 only about 32 to 34 per cent. was used for industrial and technical purposes. In the United Kingdom the figure was 28-29 per cent., in the United States about 30 per cent. and in Italy about 25 per cent.

Since it may be taken for granted that now as before butter and lard are used almost entirely for food purposes, the changes in utilization which we have mentioned must have occurred mainly among vegetable marine animal oils and fats. This is borne out by the statistics. While, for example, of the total consumption of vegetable oils and fats in Germany in 1913, only one-third was used for food purposes, in 1928 the figure had risen to two-thirds of the total consumption.

The increased demand for food oils strengthened the tendency of industry to use less valuable oils and fats. This tendency, however, has been very limited when particular properties of the oils were required, as, for example in the varnish, paints and lacquer industries. Industry also endeavoured to render

itself partly independent of vegetable oils and fats. Thus even before the War vegetable oils were replaced by mineral oils for lubricating purposes, and in the manufacture of candles paraffin was increasingly substituted for stearin. Quite recently successful attempts have been made to produce synthetic fats.

At the present time the fats and fatty oils still used for industrial and technical purposes are mainly of vegetable origin. The relatively small quantity of animal fats and oils still employed consist chiefly of tallow and residue fats. The largest consumer of industrial fats and oils is the soap industry, their employment in the manufacture of colouring materials, lacquer, lubricants, candles, linoleum, oil-cloth, leather, textiles and tin-plate each accounting for much smaller amounts.

Of the industrial consumption of fats and oils recorded in the United States (excluding the consumption by local painters), the proportions utilized for different industries over the five years 1931-35 were as follows: 56.5 to 67.8 per cent. for soapmaking, 12.4 to 17.5 per cent. in the preparation of colours and lacquers, and 2.8 to 3.5 per cent. in the manufacture of linoleum and oil-cloth; thus only about 20 per cent. remained over for other purposes and as waste. In the United Kingdom, of the total consumption for technical purposes 59 to 65 per cent. were used in soapmaking, 25 to 33 per cent. in the preparation of colours and lacquers, and 10 to 15 per cent. for other purposes, e. g. lubricants and oils for illumination. In Germany, of the total consumption of vegetable oils and fats for industrial and technical purposes in 1928, 40 per cent. was used in soapmaking, 31 per cent. went to the preparation of lacquers, colours and varnishes, 11.8 per cent. was employed in the manufacture of linoleum and oil-cloth, and 8.2 per cent. for other purposes.

### Consumption of food fats.

Only in a few countries was the increase in the consumption of food fats and oils, which had increased everywhere during the last two decades, interrupted by the economic crisis. Indeed, in most countries and even in those with particularly high unemployment, the increase in consumption continued throughout the crisis. Any further increase in purchasing power will very probably be accompanied by a further rise in the consumption of these commodities.

The use of fat for food purposes can be considered under two main heads: for spreading on bread and in the preparation of food. The principal fat of the first type is butter. Butter consumption is therefore at its highest where the practice of spreading butter on bread is most generally diffused, that is, in the Central, North and North-West European countries, and in the countries of those other continents which have been settled mainly by emigrants from these European countries. This can be seen at once from the data on butter production and the butter trade. In all other countries the consumption of butter is small.

Only in the countries with a high consumption of butter did the conditions exist for any considerable consumption of margarine. In several such countries however, the production and consumption of margarine were either early restricted as in the United States and France, or entirely forbidden as in Canada, and Australia. But where margarine consumption was allowed to develop freely, in

many cases it approached the level of butter consumption, as in Great Britain; in some cases reached it, as in Germany, Sweden, the Netherlands, and Czechoslovakia; or in a few exceptional cases, such as Norway and Denmark, even exceeded it by more than double.

A third fat used to spread on bread is lard. Its use in this way is mainly limited to families slaughtering at home, the greater part being used for cooking and frying. In the latter use lard encounters competition from salted fat pork, and to some extent also from lard substitutes. In only a few countries, however, have the production and consumption of lard compound reached any considerable proportions.

TABLE 12. — *Consumption of Butter and Margarine in certain countries.*

In contrast to other oils and fats, the consumption of table oils only reached large proportions in countries producing olive oil. In certain of these countries, such as Italy, the consumption of olive oil is greater than that of all other fats together.

As with almost all important food materials the volume and composition of the consumption of food fats and oils is to a great extent conditioned by the climate, standard of living, occupation, way of life and the orientation of local production.

The degree to which the volume, and still more the composition, of fat consumption is affected by purchasing power is shown by the results of household budget inquiries. In the publication of the Institute mentioned at the beginning of the article <sup>(1)</sup> are assembled the results of such inquiries in Belgium, Denmark, Germany, Finland, Norway, Poland, Sweden, Czechoslovakia, the United Kingdom, and the United States. The results show the same tendencies everywhere. Where income is rising the consumption of fats and meat increases, while the consumption of carbohydrate foodstuffs and especially of cereals falls off. The trends of consumption with regard to particular fats, however, vary greatly. Above a certain level of fat consumption further increases related entirely to the more expensive fats, chief of which was butter, while the consumption of other fats declined, sometimes at an exceptional rate. In the countries mentioned butter and margarine were most affected by the variations. When incomes were rising, the consumption of butter increased without exception.

The consumption of margarine was much larger than the consumption of butter in the lower income groups in Denmark (0.7 kg. of butter and 28.4 kg. of margarine per consumption unit per annum in the lowest income group), in Germany (2.7 and 11.8 kg.), in Norway (1.3 and 23.3 kg.), in Sweden (7.5 and 12.2 kg.) and in the United Kingdom (4.0 and 7.2 kg. per head per annum). In Denmark, in contrast to the other countries, the consumption of margarine in all social groups only experienced slight fluctuations. It appears further that in Denmark margarine is not only a food material of the industrial and town populations, but in many cases also of the rural, and even agricultural, population. The very high figure of 28.4 kg. for the consumption of margarine against only 0.7 kg. for butter was, in fact, found in those households investigated in the household inquiry which were situated in rural areas. There are indeed other countries where the consumption of margarine is also fairly high in the rural areas; in general, however, margarine is primarily the food fat of the industrial worker. Both in relation to the absolute price level and the price relationships between margarine and other fats competing with it, the consumption of margarine experiences large fluctuations.

### **Production of margarine and other artificial food fats.**

Table 13 shows how outside Europe the production of margarine, lard compound and similar food fats has only assumed large proportions in the United States. Whereas margarine is the most important artificial food fat in European countries, in the United States lard compound leads. The production of lard compound has been encouraged in the U. S. A. both by past legislation restricting the production of margarine and by the large home output of cottonseed oil, a cheap raw material which is well suited for the lard compound industry. In Europe the production of lard compound and vegetable cooking fats has only reached any considerable proportions within the last two decades.

---

<sup>(1)</sup> English edition pp. 380 to 384.

Though from the outset the margarine industry met with fierce opposition from the farming population, in most countries special measures against its production were not long maintained. The production of butter and other animal fats such as lard and salted fat pork did not keep pace with the increase in demand; hence an excessive rise in prices could only be avoided and the supply of fats assured by having recourse to vegetable oils and fats, and later also whale-oil, which could only be used for food purpose in the form of margarine. With few exceptions legislation was confined to checking the illegitimate competition of margarine with butter, the prevention of adulteration and of the confusion of margarine with butter, and the observing of certain hygienic prescriptions relating to the production and sale of margarine; in short, to giving to agriculture and the consumer the protection found necessary for them. Only in Canada, Australia, New Zealand and South Africa, where food habits were favourable to a considerable consumption of margarine, were its production and consumption completely or almost completely prohibited by legislation. This occurred soon after its appearance in these countries.

This was more or less the situation before the War and in the first decade after the War. Conditions only changed radically with the onset of the depression. As a result of the rapid decline in purchasing power it gradually became more difficult to market the ever increasing output of butter in the principal margarine-producing countries. The margarine industry, on the other hand, as a result of progress in organization and technique and the abundant supplies of raw materials, was able to meet the fall in purchasing power by further reducing the already low price of margarine. Thus to take one example, the average cost per ton of fats and oils used by the German margarine industry fell from RM.865 in 1928 to RM.343 in 1933. The fall in prices was even greater in the other margarine-producing countries. No proof is required to show how this pressed on the already falling butter prices. The lower butter prices gave an increased competitive power to butter, but in many countries the effect of these low prices on agriculture was disastrous, for here there could be no solution by means of a shift to other types of production. Governments therefore began to introduce the most varied measures to protect the butter industry. Both in butter exporting and butter importing countries these measures were largely aimed at margarine. No such measures have been passed in the United Kingdom, while those taken against the production and marketing of margarine in Denmark were only temporary, and then not very far reaching; but in the United States and all the other important margarine-producing countries in Europe a whole series of special measures were taken.

All the regulations relating to the production and marketing of margarine, however, went to show that radical measures were only possible to a very limited extent. The various measures taken almost always aimed at raising the price of margarine to make it easier to sell butter; but limits were set to the extent of the rise. The difficulty is that margarine is the main food fat of a large section of the population whose position is not entirely favourable from a nutritional point of view, and with them dearer margarine leads not to the desired shift to other fats but to a reduction in their total consumption of fat; indeed, during

(4) Including the quantity of butter which must legally be mixed with margarine.

the crisis it was only cheap margarine which enabled these classes to consume reasonable quantities of fat. In nearly all countries in which the production of margarine was regulated, therefore, measures were taken at the same time to ensure an adequate and cheap supply of fat to those sections of the population whose purchasing power was small.

The decline in the output of margarine after 1930, which was caused partly by the measures directed against it and partly by keener competition from butter, lasted only until 1933 or 1934. By 1934 in several countries and by 1935 in almost all the important producing countries there was recovery in production. The position of the fats markets in these countries had changed considerably as a result of smaller crops of oilseeds, the reduced output of animal fats owing to bad fodder harvests and the compulsory limitation of production, and also in consequence of an increased demand due to less unemployment and better earning possibilities.

The nature of the fats and oils used for the margarine and other artificial food fat industries has altered greatly in the last ten years. Margarine was originally prepared almost exclusively from animal oils and fats; vegetable oils and fats were only gradually introduced. At the beginning of the century this process was accelerated by the rise in the prices of animal fats. The movement away from the fats and oils of land animals has continued until to-day, and in recent years has been interrupted in only a few countries by special measures aiming at an increased use of home products, and then generally only temporarily.

Apart from these few cases, the proportion of the land animal fats and oils at present used in the margarine and artificial food fats industries is everywhere very small. Thus in the United States their share in the margarine industry fell from 72 per cent. in 1913 to 27 per cent. in 1929, somewhat over 8 per cent. in 1936 and only 6 per cent. in 1937. In Germany's margarine and artificial food fats industry it dropped from 50 per cent. in 1913 to 5.7 per cent. in 1928, 3.5 in 1933, 2.3 per cent. in 1935, 1.1 in 1936, and 1.2 per cent. in 1937. In the margarine industry in the United Kingdom it fell from 10.6 per cent. in 1927 to about 6.0 per cent. from 1935 to 1937, and in the lard compound industry from 2.8 per cent. in 1927 to under 1 per cent. in 1936 and 2 per cent. in 1937. And in Denmark's margarine and artificial food fats industry the proportion fell from 77 per cent. in 1905 to 18 per cent. in 1913, 7 per cent. in 1928 and 6 per cent. in 1935.

The type of vegetable oils and fats which replaced animal fats varied greatly from country to country, and increasingly so as technical advances rendered large numbers of oils suitable for the manufacture of margarine.

As we have seen, in addition to land animal fats and vegetable oils and fats, a further raw material, whale-oil, has been brought into use since the War. To-day it has become one of the most important fat materials for the production of margarine and other artificial food fats. The share of whale-oil in the total quantity of oils and fats employed in Germany's margarine and artificial food fats industries rose from 9.8 per cent. in 1924 to 15.7 in 1938, 39.1 per cent. in 1933, 54.4 in 1935, 29 per cent. in 1936 and 27.7 in 1937; in the United Kingdom's margarine industry the proportion increased from 16.8 per cent. in 1927 to from

37 to 38 per cent. in the years 1933 to 1935, 42 per cent. in 1936 and 41 per cent. in 1937, and in the lard compound industry from 16.8 per cent. in 1927 to 26 per cent. in 1935 and 28 per cent. in 1936 and 1937; in Denmark's margarine industry it rose from 1.4 per cent. in 1924 to 22.7 per cent. in 1935; and finally in Norway's margarine industry the proportion in 1935 was 24.7 per cent. there being no data for earlier years.

H. BÖKER.

## CHANGES IN THE PROFITABLENESS OF AGRICULTURE IN CERTAIN COUNTRIES OF EUROPE <sup>(1)</sup>

SUMMARY: I. Introduction. — Changes in the gross return, cost of production and social income in the following countries: Switzerland, Norway, Finland, Sweden, Denmark and Württemberg (Germany). — II. Introduction. — Changes in the gross return, cost of production and social income in the following countries: Germany, Scotland, France (Soissons and Etrépagne), Hungary, Estonia, Latvia, Lithuania, Netherlands (Overijssel), Poland and Czechoslovakia.

### I.

In the first part of this article we shall study changes in the profitableness of agriculture from the beginning or end of the War to 1935-36 or 1936-37 in Switzerland, Norway, Finland, Sweden, Denmark and Württemberg. In the second part we shall deal with countries the material for which covers a more recent period. As regards Germany, the country will be dealt with as a whole in the second part, but Württemberg will be separately treated in this first part as the information about this territory is more complete, enabling us to go back to 1924 and even to consider the years immediately preceding the War.

We have drawn up graphs which show changes in the gross return, cost of production and social income during this period <sup>(2)</sup>.

<sup>(1)</sup> Previous articles on this topic have appeared in the October, November and December 1938 numbers of the *Monthly Bulletin of Agricultural Economics and Sociology*.

<sup>(2)</sup> The *gross return* is the increase in wealth obtained on the farm in the course of a year by transformation, exchange and revaluation. It thus covers money receipts, contributions in kind to the household and to subsidiary undertakings, payments in kind to employees and increases in the farm inventory.

The *cost of production* covers the expenditure through which the gross return has been obtained; the cost of labour, including an amount representing family labour earnings; expenditure, including taxes and contributions in kind, required for the running of the farm; decreases in supplies and expenses incurred in improving land fertility; depreciation charges and interest payments on assets.

The difference between the gross return and the cost of production gives the *profit or loss on total farm assets*. This shows in what proportion the prices of agricultural products must be raised or lowered for the gross return to cover exactly the cost of production.

By subtracting working expenses (the portion of the cost of production consisting of the outlay on fertilizers, seed, fodder, repairs, depreciation, and costs of management) from the gross return, the *social income* is obtained, which consists of the sum of the returns from the farm, thus including the net return (the actual return on assets), taxes and cost of labour.

A glance at these graphs will show the consequences for agriculture of the troubled period through which it has passed.

From 1914 to 1918, in all the countries considered, the gross return rose very steeply, reaching a figure well above the cost of production. In Finland the maximum was not reached until later, in 1921-22, when [devaluation took place. In Finland, Norway and Switzerland the [social income was in 1918 above the cost of production. But in Sweden from 1918, in Norway from 1919, and in Denmark and Switzerland from 1920, the gross] return fell, remaining below the cost of production. After rising slightly above the cost of production in Switzerland in 1923-24 and in Denmark in 1928-29 and 1929-30 it fell again soon afterwards. The biggest fall took place from 1930 to 1933, made still worse, in the case of Switzerland, by the cost of production maintaining its level and even rising. About 1936, however, equilibrium was restored. The gross return started to rise again and tended once more to pass the cost of production. The policy of maintaining the prices of agricultural products, which the Governments had persistently pursued, began to bear fruit. In Württemberg the gross return and the social income fell about 1927 and particularly in 1930-32. From 1933 it tended to rise as in the other countries.

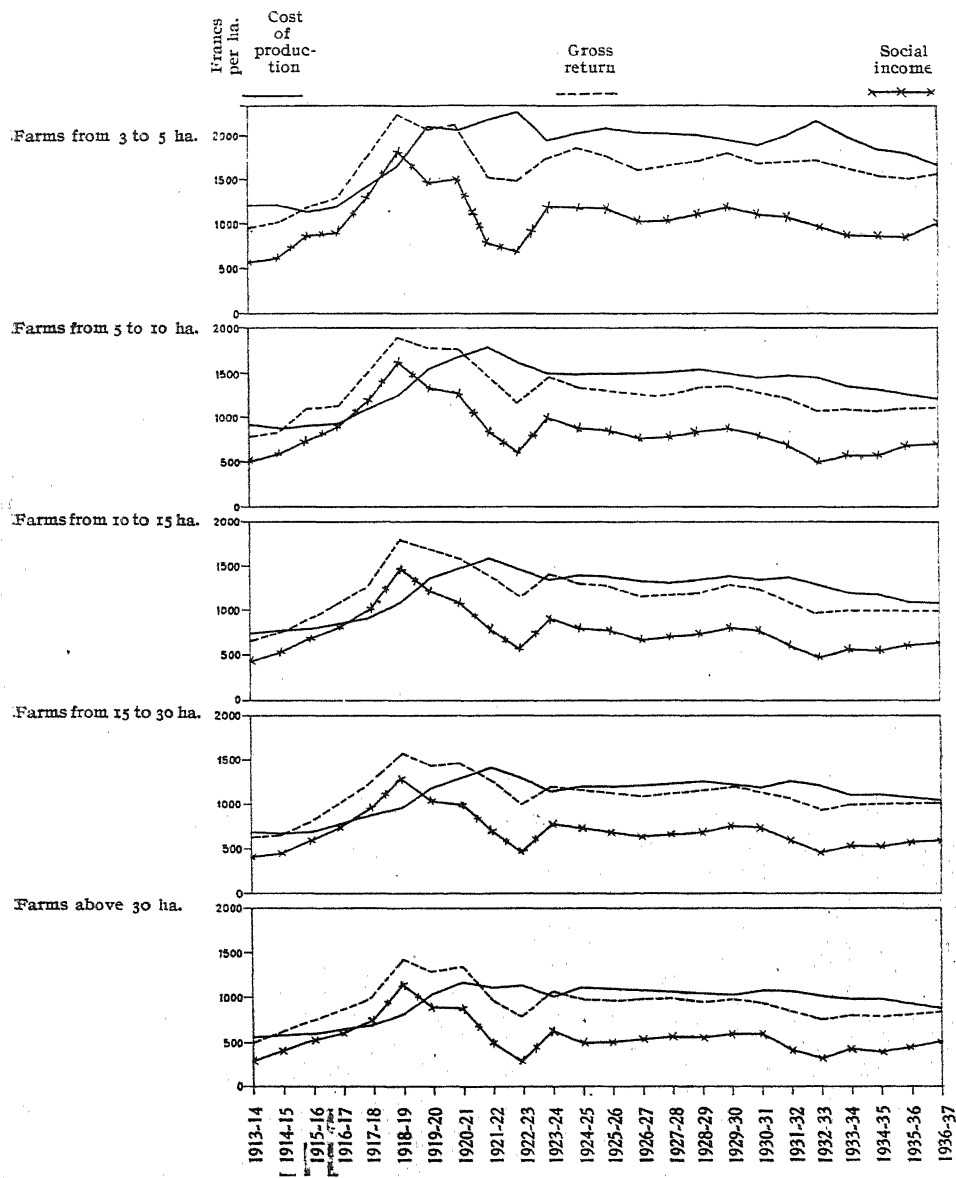

There were thus three periods of depression—that immediately following the boom at the end of the War, that of 1926-27 and that of 1929-33. In Finland there were only two—one in 1923-24, the other in 1930-33. The economic position of agriculture in Finland differed substantially from that in other countries. In Finland, the cost of production and gross return only reached their peak between 1927 and 1930, whereas in Sweden, Norway, Denmark and Switzerland the maximum figures had been reached by 1920. After a certain date, 1922 in Sweden, 1923 in Switzerland, 1925-26 in Denmark and Norway, the range of the fluctuations narrowed and the cost of production followed almost a straight line. The small farms of Switzerland, Denmark and Finland show less stable figures than the others. Danish farms experienced the smallest variations, owing to the high degree of specialization on the farms and the movement into dairy production and pig-rearing, as well as the close association between Danish agriculture and foreign trade. But the farms of less than 10 hectares stood up to the successive crises much less well than the larger farms.

From 1918 there was an increase, amounting in Finland to a trebling, of working expenses, which consist of repairs, depreciation charges, expenditure on fertilizer, seed-corn, fodder and overheads; the social income fell in a greater proportion than the gross return. From 1933, however, it began once again to move towards the latter, showing that agriculture was trying to recover its lost equilibrium.

Let us now look at the movement of prices of agricultural products and the profit or loss accruing to the peasant. To make the comparison possible we shall find the gain or loss of the peasant, representing the profit or loss on total farm assets per 100 monetary units of each country. When there is a loss the figure given will also indicate the proportion by which the prices of the farm products would have had to be raised for the gross return to cover exactly the cost of production.

## Switzerland.

During the period of transition between 1918-19, when Swiss agriculture was giving its best results, and 1922-23, the crucial year of the post-War crisis, the gross return fell while the cost of production rose. In 1922-23 the peasants

GRAPH I. — *Switzerland.*

were losing from 30 to 52 per cent. of their gross return; but the consequences of the 1932-33 crisis were not so outstanding. The farms which enabled farmers to make the highest profits in 1918-19 and which stood up best to the periods of crisis were those of from 10 to 15 and from 15 to 30 hectares. In 1923-24 for the last time they yielded a gross return above the cost of production. Similar conditions prevailed in the farms of over 30 hectares.

*Profit or Loss on Total Farm Assets per 100 francs Gross Return in Switzerland.*

	1918-19	1922-23	1923-24	1929-30	1932-33	1934-35	1935-36	1936-37
Farms of 3 to 5 ha.	26.21	— 52.15	— 12.51	— 10.17	— 25.55	— 21.11	— 20.09	— 8.38
» » 5 to 10 ha.	36.34	— 37.07	— 2.69	— 10.30	— 35.77	— 24.74	— 13.61	— 16.83
» » 10 to 15 ha.	39.00	— 28.12	1.67	— 5.00	— 30.59	— 19.40	— 9.41	— 8.71
» » 15 to 30 ha.	39.60	— 31.12	3.11	— 2.35	— 28.44	— 14.73	— 8.14	— 5.13
» » over 30 ha.	42.53	— 42.06	2.65	— 4.24	— 34.51	— 24.02	— 13.09	— 5.21

Only in 1935-36 did Swiss agriculture begin to recover from the crisis. The price index for agricultural products fell 2 points, from 112 in 1934-35 to 110 in 1936-37. The index for the cost of production moved from 155 to 148, thus dropping seven points. Farmers' losses <sup>(1)</sup> were greatly reduced, especially on farms in the 10 to 15 and 15 to 30 hectare classes. The position of farmers improved still further in 1936-37, the price index for agricultural products advancing from 110 to 119 while the cost of production index fell from 148 to 142. Thus the difference between the gross return and the cost of production has nearly disappeared.

**Norway.**

Norwegian agriculture was very prosperous in 1918-19, the gross return standing well above the cost of production; and in Trøndelag even the peasants were able to make a profit of over 40 crowns per 100 crowns gross return.

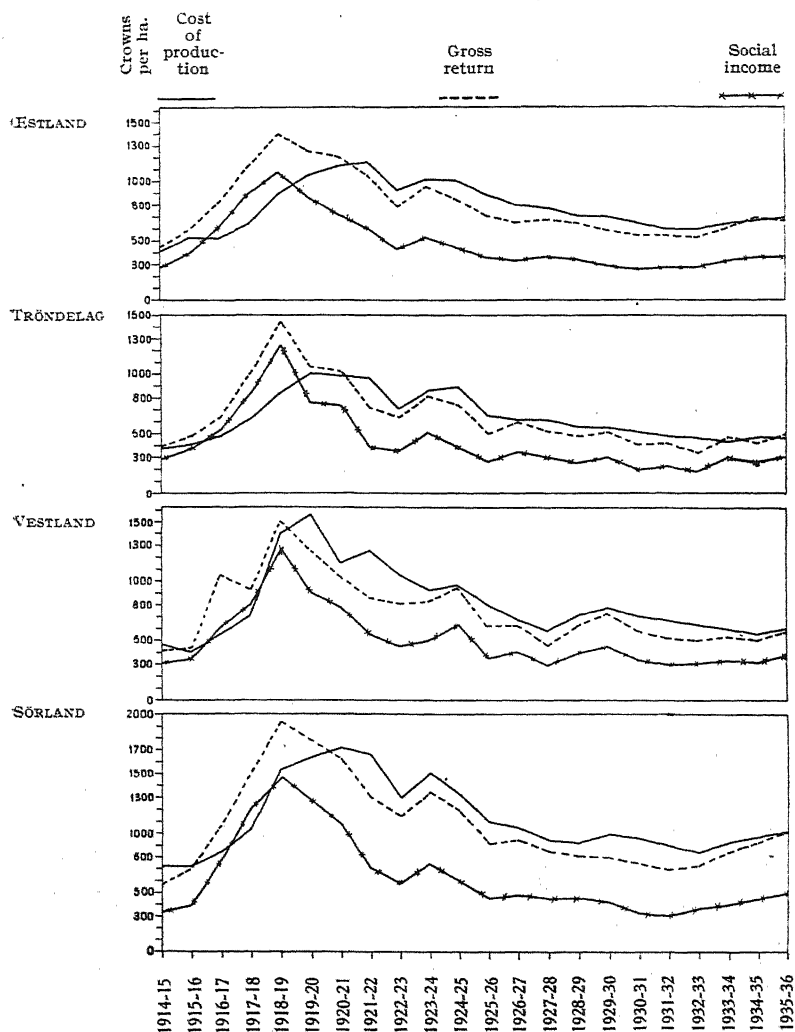

*Profit or Loss on Total Farm Assets per 100 crowns Gross Return in Norway.*

	1918-19	1922-23	1926-27	1932-33	1934-35	1935-36	1936-37
Østland . . . . .	36.15	— 12.20	— 2.40	— 13.51	— 3.08	— 1.58	— 0.84
Trøndelag . . . . .	41.52	— 16.40	— 3.21	— 15.53	— 2.33	— 6.78	— 2.36
Vestland . . . . .	6.97	— 29.28	— 2.72	— 28.82	— 12.65	— 7.73	— 2.32
Sørland . . . . .	19.97	— 14.03	— 2.09	— 27.77	— 9.27	— 5.03	— 0.16

<sup>(1)</sup> In speaking of a gain or loss, we mean the excess of the gross return over the cost of production, or of the cost of production over the gross return.

The relationship between the gross return and the cost of production was most unfavourable in the mountainous area of Vestland. The position of the peasant remained up to 1936-37 more precarious than in the other areas. The

GRAPH II. — *Norway.*

most favourable conditions are no longer found on the southern plateau, Sørland, but in Østland, which has a greater rainfall than other parts of Norway and where the forests, which have been greatly developed, led to the growth of towns and played a decisive part in the life of the peasant. During the crisis years the losses suffered by farmers were smaller than elsewhere. In 1935-36, for the first time

since 1921-22, there was a profit, amounting to 1.58 crowns per 100 crowns gross return. The gross return itself increased in a greater ratio than the cost of production, as the adjoining figures show. In the following year the cost of production rose while the gross return remained the same, and the peasant suffered a small loss.

*Cost of Production and Gross Return in Norway.*

1936-37 . . . . .	600	98	586	112	185	60	54	109	178
Sorland									
1934-35 . . . . .	933	100	854	100	276	72	138	138	230
1935-36 . . . . .	986	106	939	110	276	85	178	171	329
1936-37 . . . . .	1032	111	1030	121	314	82	215	169	350

In Trøndelag the results were not satisfactory in 1935-36 compared with the preceding year and the year following; the farmer lost about 7 crowns per 100 crowns gross return. This was due to losses on cereals, the gross return on vegetable products having fallen from 153 crowns in 1934-35 to 92 crowns. The year 1936-37 was again normal, and the gross return rose above the cost of production.

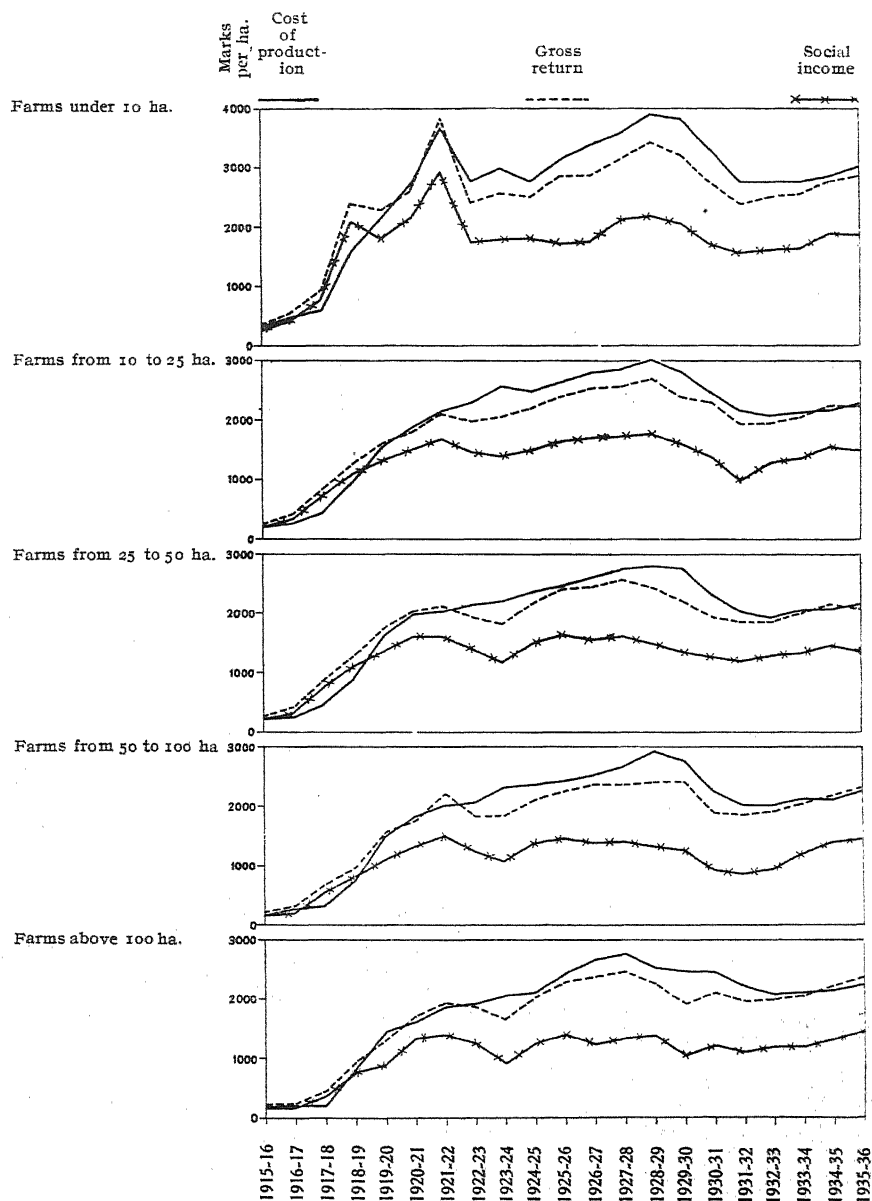

In Vestland the cost of production fell by 8 per cent. in 1935-36. In 1936-37 it rose, but to a level below the 1934-35 figure. The gross return was not high enough to yield a profit to the peasant.

In Sørland the gross return rose more rapidly than the cost of production from 1934-35, so that by 1936-37 it had almost reached the level of the latter.

### Finland.

In 1921-22, the last year in which the gross return remained clearly above the cost of production, the price of agricultural products were very high, with the exception of the prices of beef and potatoes. In 1931-32 they were at their lowest. They later rose considerably, so increasing the gross return.

GRAPH III. — *Finland.*

Farmers suffered their greatest loss in 1923-24. The gross return fell as a result of the fall in prices while the cost of production rose. In contrast, in 1929-30 the fall in gross return was accompanied by a fall in the cost of production. From

*Prices of the Principal Agricultural Products in Finland.*

(Finnish marks)

	1921-22	1923-24	1929-30	1931-32	1935-36
Milk (10 kg.) . . . . .	17.0	16.5	15.4	12.6	14.5
Butter (10 kg.) . . . . .	405	310	288	216	243
Cheese (10 kg.) . . . . .	209	185	175	153	150
Beef (10 kg.) . . . . .	72	75	78	50	70
Pigmeat (10 kg.) . . . . .	150	122	130	76	89
Wheat (100 kg.) . . . . .	350	230	209	252	255
Oats (100 kg.) . . . . .	190	165	135	112	130
Potatoes (100 kg.) . . . . .	60	70	70	48	53

1930-31 the deficit was reduced, and by 1935-36 farms of from 50 to 100 hectares and over 100 hectares were making profits of respectively 1.73 and 5.98 marks per 100 mark gross return.

*Profit or Loss on Total Farm Assets on Finnish Farms.*

(Percentage of gross return)

	1921-22	1923-24	1929-30	1931-32	1935-36
Farms of less than 10 ha. . . . .	1.27	— 17.58	— 16.96	— 15.21	— 5.75
Farms of 10 to 25 ha. . . . .	— 0.51	— 24.68	— 18.49	— 15.31	— 2.55
Farms of 25 to 50 ha. . . . .	3.98	— 21.73	— 24.35	— 9.43	— 0.99
Farms of 50 to 100 ha. . . . .	7.58	— 24.92	— 17.33	— 11.34	1.78
Farms over 100 ha. . . . .	3.59	— 21.94	— 28.25	— 12.04	5.98

**Sweden.**

There are considerable differences between the figures for farms in North, Central and South Sweden. In Norrland the main agricultural product is livestock, scarcely 1.8 per cent of the total area being used for arable farming. In Central Sweden the distribution between arable and grazing land is more equal. In the south, arable farming leads, yielding very high returns; in 1918-19 the peasants made considerable profits.

*Profit or Loss on Total Farm Assets per 100 crowns Gross Return in Sweden.*

	1918-19	1922-23	1926-27	1931-32	1934-35	1935-36	1936-37
South Sweden . . . . .	16.78	— 26.72	— 14.72	— 22.58	6.80	7.86	5.51
Central Sweden . . . . .	3.03	— 27.87	— 23.81	— 30.61	2.80	— 3.02	— 2.30
Lower Norrland . . . . .	—	—	—	— 15.27	— 9.04	— 5.96	— 12.66
Upper Norrland . . . . .	— 1.34	— 13.21	— 16.90	— 21.51	— 18.60	— 11.75	— 5.51

In 1918-19 the farms in Central Sweden yielded the farmers a profit of only three crowns per hectare for each 100 crowns gross return. In Norrland in the same period there was a loss. During the worst years of depression, 1922-23 and 1931-32, the farmers of South and Central Sweden suffered greater losses than those in Norrland. The improvement in 1934-35 proved satisfactory for the

GRAPH IV. — *Sweden.*

peasants of South and Central Sweden, who made considerable profits. In 1935-36 the position improved still further, the farms in South Sweden yielding a larger profit than in 1934-35, while the Norrland farms experienced a reduction in their annual deficit. The gross return of farms in Central Sweden, however, fell of the same year below the cost of production, the actual loss being about 6 crowns per 100 crowns gross return. The price index (1909-13 = 100) for livestock products rose from 107 in 1934 to 121 in 1935 and the price index for vegetable products from 107 to 108, while the price index for goods needed in farming rose from 121 to 129. In 1936 the price index for livestock products reached 131, while the index for vegetable products remained at 108, the price index for goods needed

in farming rising to 133. It was probably due to the rise in the prices of animal products that farmers in Upper Norrland were able to halve their deficit in 1936-37. The rise in prices of articles needed for running their farms and the pause in the upward movement of the prices of vegetable products led to the peasants earning a smaller profit in this year than in the year before.

### Denmark.

A glance at Graph V shows three years of prosperity, 1920-21, 1924-25 and 1928-29; three years of deep depression, 1921-22, 1926-27 and 1931-32; and four years during which the gross return tended to approach the cost of production, the years between 1932-33 and 1935-36. The gains and losses experienced by Danish peasants during these three periods were as follows:

GRAPH V. — *Denmark.*

*Profit or Loss on Total Farm Assets per 100 crowns Gross Return in Denmark*

	1920-21	1921-22	1924-25	1926-27	1928-29	1931-32	1934-35	1935-36	1936-37
Farms of less than 10 ha. . . . .	2.26	— 14.19	7.57	— 9.07	3.16	— 20.74	— 3.67	— 3.83	— 10.62
Farms of 10 to 20 ha. . . . .	5.74	— 14.53	9.86	— 10.91	3.49	— 25.18	— 2.48	— 0.61	— 7.47
Farms of 20 to 30 ha. . . . .	6.22	— 10.39	10.61	— 12.74	5.04	— 21.27	— 2.72	— 0.53	— 7.10
Farms of 30 to 50 ha. . . . .	6.62	— 12.37	10.20	— 15.29	4.24	— 23.30	— 1.47	— 1.16	— 6.69
Farms of 50 to 100 ha. . . . .	6.55	— 15.36	9.57	— 14.95	4.96	— 23.25	— 1.58	— 1.04	— 5.65
Farms of over 100 ha. . . . .	2.50	— 11.08	8.65	— 17.77	5.80	— 26.63	— 2.49	— 0.46	— 4.17

The most prosperous year was 1924-25, the worst, 1931-32. The farms giving the best results in 1924-25 were those of from 20 to 30 and from 30 to 50 hectares; these farms, together with those of less than 10 hectares, also suffered least during the worst period of depression, 1931-32. The figures for 1934-35, 1935-36 and 1936-37 show how difficult it is to reduce costs of production under the highly industrialized system of farming used in Denmark. While the price index for agricultural products moved from 116 in 1934-35 to 115 in 1935-36 and to 118 in 1936-37, the price index for goods needed in farming moved as follows:

(1909-1914 = 100).

	1934-35	1935-36	1936-37
Fodder concentrates . . . . .	107	106	131
Fertilizers . . . . .	90	91	93
Building materials . . . . .	172	176	185
Equipment . . . . .	164	168	176

The considerable increase in the prices of goods needed in farming explains perhaps the greatly increased deficit in 1936-37. The best year since 1929-30 was 1935-36, when losses were reduced to a minimum, and farms of from 50 to 100 hectares even yielded a small profit to their farmers. In spite of the lower value yielded by pig fattening, the increase in the gross return from milk production, the raising of meat cattle and arable farming has been such as to lead to an increase in the gross return well above the cost of production in these farms of 50 to 100 hectares:

	Cost of production in crowns per hectare	Gross return in crowns per hectare in Denmark					
		Total	Vegetable products	Cattle	Milk	Pigs	Other products
1934-35 . . .	449	442	77	31	141	146	47
1935-36 . . .	475	480	95	40	165	130	50

### Württemberg (Germany).

Before the War agriculture was being carried on at a loss in this country. We do not know what the position was during and after the War, the accounting office having resumed work only in 1924. In 1924-25 the difference between the cost of production and the gross return was greater than in 1912-13 on farms in rather unfavourable positions, less great on farms in good positions. After falling in 1927-28 the cost of production and the gross return rose in

GRAPH VI. — *Württemberg (Germany).*

1928-29, the latter more rapidly. Then, up to 1931-32 the cost of production and gross return fell, so great being the fall in the latter that the peasants on the best-placed farms lost 32 marks per 100 marks gross return and those on the less well placed farms 44 marks.

From 1933-34 the gross return began to rise again, cereals giving very good yields and being of excellent quality, while the rise in prices of milk for manufacturing also helped to improve the situation. In the next year the crops were not less satisfactory than the year before, but the main factor to raise the level of the gross return was the upward movement of the prices of animal products. The price index for slaughter cattle rose from 64.3 in 1933-34 to 70.9 in 1934-35

and the price index for animal products from 97.5 to 105.0. Peasants' profits in the middle and lower Neckar areas, where natural conditions are most favourable for farming, were 9 marks per 100 marks gross return. In the other areas the deficit was greatly reduced.

*Profit or Loss on Total Farm Assets per 100 marks Gross Return  
in Württemberg.*

	1912-13	1924-25	1928-29	1931-32	1934-35	1935-36	1936-37
Favourably situated farms . .	— 16.12	— 11.43	— 1.53	— 31.65	9.31	2.94	—
Less favourably situated farms	— 20.04	— 30.32	— 6.65	— 30.43	— 2.52	— 0.13	—
Unfavourably situated farms	— 21.74	— 36.71	— 14.87	— 44.05	— 5.10	— 3.53	—

In 1935-36 farms situated in an unfavourable position and those in an average position gave better results than in the previous year. On the farms in a favourable position the average profit to farmers fell to about 7 marks, per 100 marks gross return, the gross return itself also falling as the crops had suffered from drought. In 1934-35, the yield per hectare in the middle and lower Neckar area was 29.2 quintals for wheat, 29.4 for rye, 29.9 for barley, 32.9 for oats and 203 for potatoes; in 1936 only 24.9 quintals of wheat, 24.6 of rye, 26.4 of barley, 27.5 of oats and 182 of potatoes were harvested. The changes in social income, which have been about the same as the changes in gross returns, are shown in the following table.

*Social Income per hectare.*

(1912-13 = 100).

	1928-29	1931-32	1933-34	1934-35	1935-36
Favourably situated farms . . . . .	129	62	82	102	94
Less favourably situated farms . . . . .	107	62	66	81	87
Unfavourably situated farms . . . . .	116	65	91	96	101

INTERNATIONAL CHRONICLE OF AGRICULTURE

## ITALY

As regards price movements in the home market, economic conditions in Italy have been characterized by a tendency to relative stability of wholesale prices, while in foreign trade there has been an improvement in the balance of trade.

According to the figures of the Central Institute of Statistics, the movement of trade with foreign countries during the last two years has been as follows:

	1937 (Thousand lire)	1938
Imports . . . . .	13,592,185	10,918,183
Exports . . . . .	7,853,086	7,959,547
Balance . . . . .	<u>— 5,739,099</u>	<u>— 2,958,636</u>

The value of exports in 1938 was slightly (1.3 per cent.) above that in 1937, while imports fell by 19.7 per cent., mainly as a result of greatly reduced purchases of wheat, which fell from 1,387,541,000 lire in 1937 to 216,450,000 lire in 1938. Even leaving the value of wheat out of account, however, there is still a fall in imports of 12 per cent. This fall is partly to be attributed to the fall in the prices of imported goods. The excess of imports has thus been reduced from 5,739 millions in 1937 to 2,959 millions in 1938, a fall of 2,780 million lire.

The value of Italy's foreign trade is shown below:

	1937 (Thousand lire)	1938
<i>Imports</i>		
Raw materials for industry . . . . .	5,989,483	5,212,263
Semi-manufactured materials for industry . . . . .	2,889,562	2,375,422
Finished goods . . . . .	1,907,861	2,013,047
Foodstuffs and living animals . . . . .	2,805,279	1,317,451
Total . . . . .	<u>13,592,185</u>	<u>10,918,183</u>
<i>Exports</i>		
Raw materials for industry . . . . .	947,859	807,371
Semi-manufactured materials for industry . . . . .	1,722,973	1,579,630
Finished goods . . . . .	2,724,234	2,864,268
Foodstuffs and living animals . . . . .	2,458,020	2,708,278
Total . . . . .	<u>7,853,086</u>	<u>7,959,547</u>

During the two years considered, there has been a large reduction in the value of imports of foodstuffs and live animals, their share of total imports falling from 20.6 per cent. to 12.1 per cent. In absolute figures imports of raw materials have also fallen; imports of oilseeds fell from 513.1 million lire in 1937 to 199.5 million lire in 1938; of cotton from 1,041.1 million to 807.4 million lire and of wool from 434 to 340 millions.

In exports, the percentage of foodstuffs and living animals exported increased from 31.3 to 34.1 per cent. and of finished goods from 34.7 to 36 per cent. Foodstuffs earned about 250 million lire, mainly as a result of increases in fruit and market garden products.

The Government has recently given the following instructions for the exportation of farm products, which consist largely of fruit and market garden products:

- a. to turn more and more to the production of higher-priced varieties;
- b. to revise methods of cultivation so as to keep costs of production within the limits set by competition;
- c. to raise the value of the products by bettering their quality;
- d. to improve the organization of transport and the costs involved;
- e. to reorganize the home market so as to increase consumption and regulate production.

### New economic organization of agricultural producers.

In the Chronicle of last December we spoke of the Law of June 16, 1938 which set up provincial consortia of agricultural producers. We saw how they are defined as organizations to control and develop the work of producers in the provinces, and that this control and development is to be carried out in accordance with the instructions of the Ministry of Agriculture and Forests and the farm corporations.

The consortium, which is composed of all the landowners and tenants of the province, must carry out the production plans for autarchy. By the regulations published in the Royal Decree of February 2, 1939 (1), the consortium consists of six sections, representing respectively the cultivation of cereals, the vine, the olive, fruit and market gardening, textile fibres and animal husbandry. Other sections may be formed, adding to or replacing those mentioned.

The sections are intended to protect the interests of agricultural producers "in harmony with the economic interests of the nation". In addition they are to encourage technical and economic progress in the branch of production which they direct.

Technical progress is encouraged, *inter alia*, by spreading the knowledge of appropriate systems of cultivation and by the campaign against plant diseases and insect pests. The Government has already appropriated 100 million lire for this campaign.

In the economic sphere the sections are required to regulate crops by the system of "crop licences" already applied to hemp, the castor oil plant, sugar beet and tomatoes. They must also regulate the marketing of the products.

The sections shall:

- a. regulate the output of the products and inform the competent authorities of faults and imperfections and infringements of the laws and corporative regulations;
- b. undertake the accumulation of stocks of goods, and the taking of the measures necessary for paying the producers by whom the goods were supplied or selling these goods;
- c. construct, or contribute to the construction of warehouses and equipment for storing, sorting and processing the products and by-products.

---

(1) *Gazzetta Ufficiale del Regno d'Italia*, February 16, 1939, No. 39.

The law entrusts the administration of the *ammassi* or collective stocks of products to the consortia. In operations connected with the preservation, processing and sale of the products so stocked they may employ the services of the agricultural consortia of the provinces, which in this matter will function as executive bodies.

The production plans worked out by the corporations are regulated to adapt national production as far as possible to the needs of consumption. They will be applied by the new consortia with the concurrence of the parties concerned, the employers and the workers.

These measures will enable the producers' consortia to undertake obligations towards the State, the syndical organizations and the various processing industries "to furnish a given quantity of products or to place a given area under a given crop".

As we have said, the former agricultural consortia, converted from co-operative societies with limited liability into public utility associations <sup>(1)</sup>, work in close collaboration with the provincial producers' organization. In all the provinces they have been formed compulsorily into a single body called a provincial agricultural consortium, which in general performs the following operations under the Ministerial Order of February 2, 1939 <sup>(2)</sup>:

a. it buys anywhere on its own account, or for the account of third parties, and distributes among the farmers of the province what they may require for their farms and the related industries;

b. it sells for cash or on credit either at home or abroad its own products or those of the provincial farmers, to the account of the provincial producers' consortia;

c. it administers directly, or in collaboration with the provincial producers' consortia, factories for the production of commodities used in agriculture and the processing of agricultural products;

d. it may hire out or sell agricultural machines and equipment to the farmers of the province;

e. it procures for, and assists farmers of the province to obtain, agricultural credit, also making use of farm credit in kind;

f. it may construct or assist in the construction of warehouses, laboratories, workshops, refrigerating plant, for the purchase and sale, processing, preservation, preparation or manufacture of commodities for the use of farmers and farm produce.

These organizations are forbidden to undertake any speculative operations or commercial operations not connected with agriculture.

Another type of economic organization is now represented by the National Association of Beet Growers, the Association for oil-yielding Herbaceous Plants and the Union for Oil Fuels, Lubricants and Farm Motors. The first two regulate the cultivation respectively of sugar-beet and oil-yielding plants and arrange contracts with manufacturers for the supply of the products. By such "collective economic agreements" the farmers are guaranteed equitable conditions for the marketing of their produce.

All the above types of agricultural organization are of a public nature; in addition private organizations such as co-operative wine-cellars, co-operative cheese-dairies, co-operative organizations for fruit growing and market gardening, and co-operative drying-rooms for cocoons have been formed to eliminate unnecessary middle-men and to ensure remunerative prices for the principal products.

<sup>(1)</sup> See the Chronicle cited above.

<sup>(2)</sup> *Gazzetta Ufficiale*, February 4, 1939, No. 29.

## Revision of national employment regulations:

The Decree-Law of December 21, 1938 <sup>(1)</sup> changed the organization of the labour market. The Decree lays down that the employment of workers is "a public concern in the interest of national production and the State". Hence persons charged with the appointment of labour must be considered as "public officers". The finding of employment is entrusted to the professional associations of labour, which are considered the most suitable bodies for this purpose.

The Decree-Law of December 21, 1938 makes it a basic rule that the worker should be engaged by the employment bureau dealing with his own occupation. A distinction is made between the demand for a specified individual and the demand for a certain number of unspecified workers. This distinction is important for the agricultural section, where it is recognized that as well as confidence between employer and worker, ability on the part of the worker is necessary and must be demonstrated, not only in the interests of the farm in question, but also of production in general. Thus employers are allowed to engage labour directly in all cases where there is a risk of damage to persons, raw materials or equipment, or to ensure the continuity of the work. These cases occur principally under conditions requiring the continuity of labour or where work is urgent.

Other exceptions to the principle that labour should be engaged through the intermediary of employment bureaus refer to:

- a. the employer's relatives, not beyond the third degree of kinship, living with him and at his charge;
- b. the managing staff with responsibility for the development of the enterprise, that is to say all those included in the managing and technical staff;
- c. all workers working in "co-participation", including *métayers*, and sharecroppers in general; clearly where there is or should be a relationship of confidence the workers cannot be employed at random;
- d. cases in which the demand for labour must be specific, i. e. where the demand is for workers qualified for a given work requiring special knowledge.

The labour officers must satisfy the needs of employers, by obtaining workers with the special qualifications asked for. Professional ability being equal, preference will be given to applicants for employment in accordance with (*inter alia*) the position of the family and the number of children supported. The worker is therefore no longer considered as a single individual but in relation to his family.

For the engagement of agricultural workers, the confederation of Farm Labourers has set up an employment bureau in each province and is organizing a network of communal bureaux. There will be about 7,000 agricultural employment bureaux operating throughout Italy.

To enable an equitable distribution of labour in accordance with the conditions in each zone to be made, the Confederation has drawn up a worker's card which will make it possible to follow the man's work and which will also show his economic condition and the position of his family.

The employment service is superintended by the Ministry of Corporations, to which is attached the Central Employment Commission. This organization must give general administrative and technical directions to assure the regulation of employment and its co-ordination with internal migration and emigration abroad.

---

(1) *Gazzetta Ufficiale*, December 30, 1938, No. 298.

### Price regulation and adjustment of wages.

To avoid market fluctuations and unjustified increases in the cost of living a Decree-Law of June 16, 1938<sup>(1)</sup> authorized the Central Corporative Committee to fix maximum selling prices for goods of every description. However, if there occurs some disequilibrium between costs and prices which is harmful to production, the Government may take exceptional measures. To achieve a proper regulation of prices, collective agreements are already in operation in certain branches of production. The corporation may be requested to examine questions relating to the prices of goods and services, which matters also fall within the scope of the activities of the advisory committees set up by the Decree-Law of January 4, 1938.

The presiding committees of the provincial councils of the corporations ascertain and regulate prices in their own provinces, and periodically publish a list of maximum wholesale and retail prices for the most widely consumed goods. This list is compulsory for sales occurring in the territory of the main commune of the province, while for the other communes of the province special lists are periodically published. The sale at prices above those given in these lists is forbidden.

By the same decree the prohibition against increasing the leases paid on urban real estate and rural property, dated October 5, 1936 (stabilization of the lira) is extended to December 31, 1940, even if other tenants or tenant-farmers take over the use of the property. In the year following the expiration of the lease the tenant may reclaim anything he may have paid in excess.

Another regulation enables the Ministry of Corporations to order enquiries in regard to commodity stocks held in farms, warehouses, etc.

As part of the general adjustment of wages to the cost of living, the central Corporative Committee has approved the revision of the wages of agricultural labourers, agreed upon by the two Confederations of Agriculture. The new schedules came into force on March 23, 1939. By this agreement wages under collective contracts at present in force are increased by 8 per cent. for regular labour, day-labourers and specialised labour. However, farm labourers of 12 provinces in the basin of the Po, who were granted an earlier increase of 6 per cent. by the Interconfederal Agreement of October 8, 1938, will now only receive an increase of 6.5 per cent.

Of wages paid in money and kind, the percentage increase provided affects only the part paid in money.

The money part of the minimum salaries fixed by contract, and the current salaries of administrative and technical employees of farms and forest undertakings, are increased by 8 per cent.

### Inheritance of farms.

The legal commission to draw up the third book of the new Civil Code accepted the principle that farms shall be inherited as a whole.

When one or several rural properties constituting an economic unit, the revenue from which does not exceed the normal needs of a farm family, form part of the inheritance, and when the deceased does not name the inheritor, the commission has decided that this unit will be allotted in its entirety, as part of the inheritance, with tools, equipment, and the deadstock and livestock belonging to it, to that inheritor who is prepared to accept the inheritance and who is deemed capable of farming the properties.

(1) *Gazzetta Ufficiale*, September 13, 1938, No. 209.

A Government regulation will fix for each zone, taking account of the estimates of the land survey, the maximum and minimum areas corresponding to the needs of a normal farm family. If several eligible inheritors claim the inheritance, and the deceased has not named an heir, the judicial authority will choose the one who does or could farm the properties mainly with the work of himself and of his family, and who is in a position to improve these properties. If these conditions are fulfilled by more than one claimant, the one descending in the direct male line will be chosen. Other conditions being equal, a claimant who has already farmed the properties or the one with the largest number of male children will be preferred.

The properties may also be awarded to several co-heirs asking to farm them in common.

If the heir is not in a position to repay the shares due to his co-heirs without contracting debts too onerous for the farm, the judicial authority may authorize him to repay the co-heirs in instalments, including also the part due to them from the revenue of the farm. The farm continues to be held in common with the co-heirs throughout the period of repayment.

## UNION OF SOUTH AFRICA

With the exception of the gold-mining industry all branches of the economic life of the Union suffered last year from the recession in world markets and the political uncertainty in Europe. Nevertheless the decline which has taken place in South Africa is not considered unfavourably, and the Union still counts as one of the economically soundest countries of the world. The Finance Minister in his budget speech of March 15, 1939 was able to point to a surplus of £1,650,000 instead of the deficit of £100,000 of his original estimate, this favourable development being due to the greater receipts from the taxation of the gold-mines and other mining concessions.

The volume of foreign trade reckoned according to value has shown a considerable decline as against 1937, especially as regards the export of agricultural products. However, by comparison with the year 1930-34 preceding the revival, this decline in foreign trade may rather be considered as a healthy consolidation.

Despite a record gold production of 833,903 lb. in 1938 as against 804,692 lb. in the preceding year, the export of gold bars has declined in value from £82.7 million in 1937 to £48 million in 1938. But when considering the gold exports, account must also be taken of the earmarked gold, that is to say of the gold that was deposited for safe-keeping with the South African banks after the September crisis to be held to the account of overseas buyers. Thus the gold reserves of the South African Reserve Bank have risen by nearly 8 million in the course of 1938.

### *Foreign Trade of the South African Union.*

Wines . . . . .	1,700	1,900	233,500	265,100

As regards agricultural products, the exports of maize and wool were most adversely affected. Despite an increase in the quantity of wool exported from 237.3 million lb. in 1937 to 244.4 million lb. in 1938 the value of the wool exports showed a noticeable decline, partly due to the falling price levels in the world market, but partly due also to the growing world production of artificial fibres. The decline in the maize exports is mainly explained by the maize harvests having been considerably worse than in the previous year as a result of drought and delayed rains (3,521.9 million lb. in 1937-38 as against 5,621.8 million lb. in 1936-37).

Corresponding to the decline in purchasing power of the farming population there has also been a decline in imports, particularly of textiles, machines and motor vehicles. Increases of imports were shown only by foodstuffs, which rose from £4,781,450 in 1937 to £4,920,000 in 1938, by drink which rose from £604,000 to £646,000, and by fodder which rose from 7.45 million lb. worth £35,000 to 9.2 million lb. worth £47,000. Most striking of all, however, was the increase in wheat imports from 1.0 million lb. worth £5,780 in 1937 to 157.0 million lb. worth £459,700 in 1938.

The prospects for the maize harvest are, according to the latest estimates, exceptionally favourable, so that 6.000 million lb. are being expected for 1939. The 1938-39 wheat harvest amounted to 1,045 million lb. as against 609.4 million lb. in the preceding year, the tobacco crop to 23.9 million lb. as against 20.6 million lb. and sugar production to 1,041.9 million lb. as against 1,014.4 million lb. The wool clip for 1938-39 amounted to 261,000,000 lb. (greasy) as against 246,000,000 lb. in 1937-38, and is favourably judged as regards quality, although higher prices are hardly to be hoped for so long as the present international tension lasts.

Industrial prices have shown a much quicker recovery than agricultural ones, and agricultural wage-rates cannot keep pace with industrial wage-rates, so that an increasing flight from the land is the inevitable consequence.

To summarize, one can say that owing to the rise in gold prices and the consequent expansion in the mining industries South Africa's general economic situation is one of moderate prosperity (<sup>1</sup>). As regards the weak position of agriculture, that

<sup>1</sup> See the Annual Report of the Minister of Agriculture (August 1937-August 1938) in *Farming Africa*, December 1938; *Zuid-Afrika*, March 1939 and following numbers.

is to be improved by new trading agreements, by the development of the system of market regulation initiated in 1937, and by other State measures of support and development.

### Trade agreements.

The agreement between the Union and *Germany* was renewed on September 19, 1938 for the fifth time. The Governments of the two countries had agreed to conclude the new agreement on September 1, that is, two months before the expiration of the old one, so that Germany should be able to make her wool purchases already at the beginning of the new wool season. However, as a consequence of the political crisis in Europe the negotiations were delayed some weeks. The amount of the agreement was provisionally fixed at £6,355,000, as against £5,686,000 in the preceding year, roughly corresponding to the value of the trade in the calendar year 1937. Agricultural products accounted for £5,200,000 in the September agreement, the German wool purchases to the value of £3,760,000 constituting easily the main item. In the middle of May 1939, however, the amount of the agreement was increased to £6,700,000 of which £5,475,000 is to be accounted for by agricultural products, the German wool purchases being increased to £4,000,000 under the amended agreement. Payment will be made in German goods.

In the wool season 1938-39 Germany purchased about 40 per cent. of the Union's wool output, and is now the chief market for the wool exports of the Union. Critics have wished to attribute the decline in wool prices to the German-South African Agreement, but the Secretary of State for Agriculture, Dr Viljoen, pointed to the sure market guaranteed by the Agreement, and declared that the decline in wool prices must be attributed to the recession which has taken place in the world markets. At the annual congress of the "National Woolgrowers' Association" (Cape branch), held at the end of March 1939, it was resolved to request the Government that the payment facilities granted to Germany by the terms of the Agreement be extended also to the other wool-importing countries.

Further trade agreements are in course of preparation, and negotiations are already being carried on between the Union and the United Kingdom, as also with France, Brazil, Poland and Egypt.

The new agreement with the *United Kingdom* is to contain a modification of the preferential tariffs accorded at the Ottawa Conference, the value of which has been adversely affected by the conclusion of the Anglo-American Trade Agreement of November 1938. The lowering of the import duties on American apples, pears and preserved fruits promised by the United Kingdom means for the South African fruit-growers and exporters to Great Britain the loss of their former profit margin. In other respects, however, the Anglo-American Trade Agreement was welcomed in South African economic circles. Much is hoped for especially from the lowering of the import duties on British woollen goods promised by the U. S. A., which is expected to stimulate the Union's wool exports. Favourable consequences are also expected from the promised co-operation of American fruit exporters with the Empire Fruit Council as regards the export of fresh, dried and preserved fruit, which is so important for South Africa.

The Agreement with *France* is to be on a far broader basis than the one concluded in August 1935. Negotiations are also in process with *Morocco*.

Most-favoured-nation treaties are to be concluded with *Brazil* as also with *Poland*. Poland purchases wool, skins, hides and wattle bark from the Union, yet until now there has never been a commercial treaty between the two countries.

*Principal Agricultural Exports of the Union.*

As regards agricultural products, the exports of maize and wool were most adversely affected. Despite an increase in the quantity of wool exported from 237.3 million lb. in 1937 to 244.4 million lb. in 1938 the value of the wool exports showed a noticeable decline, partly due to the falling price levels in the world market, but partly due also to the growing world production of artificial fibres. The decline in the maize exports is mainly explained by the maize harvests having been considerably worse than in the previous year as a result of drought and delayed rains (3,521.9 million lb. in 1937-38 as against 5,621.8 million lb. in 1936-37).

Corresponding to the decline in purchasing power of the farming population there has also been a decline in imports, particularly of textiles, machines and motor vehicles. Increases of imports were shown only by foodstuffs, which rose from £4,781,450 in 1937 to £4,920,000 in 1938, by drink which rose from £604,000 to £646,000, and by fodder which rose from 7.45 million lb. worth £35,000 to 9.2 million lb. worth £47,000. Most striking of all, however, was the increase in wheat imports from 1.0 million lb. worth £5,780 in 1937 to 157.0 million lb. worth £459,700 in 1938.

The prospects for the maize harvest are, according to the latest estimates, exceptionally favourable, so that 6.000 million lb. are being expected for 1939. The 1938-39 wheat harvest amounted to 1,045 million lb. as against 609.4 million lb. in the preceding year, the tobacco crop to 23.9 million lb. as against 20.6 million lb. and sugar production to 1,041.9 million lb. as against 1,014.4 million lb. The wool clip for 1938-39 amounted to 261,000,000 lb. (greasy) as against 246,000,000 lb. in 1937-38, and is favourably judged as regards quality, although higher prices are hardly to be hoped for so long as the present international tension lasts.

Industrial prices have shown a much quicker recovery than agricultural ones, and agricultural wage-rates cannot keep pace with industrial wage-rates, so that an increasing flight from the land is the inevitable consequence.

To summarize, one can say that owing to the rise in gold prices and the consequent expansion in the mining industries South Africa's general economic situation is one of moderate prosperity <sup>(1)</sup>. As regards the weak position of agriculture, that

<sup>(1)</sup> See the Annual Report of the Minister of Agriculture (August 1937-August 1938) in *Farming in South Africa*, December 1938; *Zuid-Afrika*, March 1939 and following numbers.

is to be improved by new trading agreements, by the development of the system of market regulation initiated in 1937, and by other State measures of support and development.

### Trade agreements.

The agreement between the Union and *Germany* was renewed on September 19, 1938 for the fifth time. The Governments of the two countries had agreed to conclude the new agreement on September 1, that is, two months before the expiration of the old one, so that Germany should be able to make her wool purchases already at the beginning of the new wool season. However, as a consequence of the political crisis in Europe the negotiations were delayed some weeks. The amount of the agreement was provisionally fixed at £6,355,000, as against £5,686,000 in the preceding year, roughly corresponding to the value of the trade in the calendar year 1937. Agricultural products accounted for £5,200,000 in the September agreement, the German wool purchases to the value of £3,760,000 constituting easily the main item. In the middle of May 1939, however, the amount of the agreement was increased to £6,700,000 of which £5,475,000 is to be accounted for by agricultural products, the German wool purchases being increased to £4,000,000 under the amended agreement. Payment will be made in German goods.

In the wool season 1938-39 Germany purchased about 40 per cent. of the Union's wool output, and is now the chief market for the wool exports of the Union. Critics have wished to attribute the decline in wool prices to the German-South African Agreement, but the Secretary of State for Agriculture, Dr Viljoen, pointed to the sure market guaranteed by the Agreement, and declared that the decline in wool prices must be attributed to the recession which has taken place in the world markets. At the annual congress of the "National Woolgrowers' Association" (Cape branch), held at the end of March 1939, it was resolved to request the Government that the payment facilities granted to Germany by the terms of the Agreement be extended also to the other wool-importing countries.

Further trade agreements are in course of preparation, and negotiations are already being carried on between the Union and the United Kingdom, as also with France, Brazil, Poland and Egypt.

The new agreement with the *United Kingdom* is to contain a modification of the preferential tariffs accorded at the Ottawa Conference, the value of which has been adversely affected by the conclusion of the Anglo-American Trade Agreement of November 1938. The lowering of the import duties on American apples, pears and preserved fruits promised by the United Kingdom means for the South African fruit-growers and exporters to Great Britain the loss of their former profit margin. In other respects, however, the Anglo-American Trade Agreement was welcomed in South African economic circles. Much is hoped for especially from the lowering of the import duties on British woollen goods promised by the U. S. A., which is expected to stimulate the Union's wool exports. Favourable consequences are also expected from the promised co-operation of American fruit exporters with the Empire Fruit Council as regards the export of fresh, dried and preserved fruit, which is so important for South Africa.

The Agreement with *France* is to be on a far broader basis than the one concluded in August 1935. Negotiations are also in process with *Morocco*.

Most-favoured-nation treaties are to be concluded with *Brazil* as also with *Poland*. Poland purchases wool, skins, hides and wattle bark from the Union, yet until now there has never been a commercial treaty between the two countries.

### Market regulations under the Marketing Act.

The Marketing Act of June 1937 forms the basis of a carefully planned system of regulation of agricultural marketing. The production and sale of the main agricultural products are controlled and in the case of their sale to some extent monopolised by marketing boards either already existing or shortly to be created, which are all subordinate to the National Marketing Council <sup>(1)</sup>. The Law provides for the drawing up of a series of marketing schemes, the plans for which are first to be laid before the Minister of Agriculture for his provisional approval, then to be passed to the Marketing Council for discussion, and after examination of all proposed suggestions and objections to be presented to the Governor-General for final approval.

Already in the second year of its existence a modification of the Marketing Act proved to be necessary. Numerous difficulties arose, e.g. as regards the transfer of funds from the earlier boards to the newly-founded Board, but mainly because the wording of the Law made an effective control of the producers and the importers difficult.

*Marketing Amendment Act.* — For this reason the Marketing Amendment Act <sup>(2)</sup> of September 1938 includes a wider definition of "producer", which for the purposes of any marketing scheme under the Act now includes those who import or process a product. Thus for the purposes of the marketing scheme a product imported into the Union counts as a product of the Union, except where expressly stipulated to the contrary. However, the distinction between import duties and the levies imposed on the products of the Union for the benefit of the Boards is still preserved. The powers of control of a Board are extended from production to include also consumption, which may be subjected to the quota system or even prohibited altogether within the framework of a marketing system. Furthermore the Boards set up under the Marketing Act are empowered to collect together the funds of any former board or boards of the same branch of the national economy in a special Fund for the furthering of the marketing system where they may be used at discretion.

*Maize Control Scheme.* — Under the maize scheme of last year <sup>(3)</sup> the Board imposed a levy on all maize sales within the country, which was originally fixed at 1 shilling and later increased to 18 pence per bag. From the funds thus accruing the Board granted export subsidies calculated according to overseas prices, which subsidies were originally fixed at 27 pence per bag, then at 39 pence per bag, and since February of this year at 30 pence per bag. Of last year's harvest, of 19 million bags of 200 lb., 4.5 million were exported under permits granted by the Board, whilst 5.5 million bags were sold in the home market, the rest remaining with the producers. However, the harvest and consequently the export surplus had been underestimated at

<sup>(1)</sup> See the May 1938 number of this Chronicle, p. 255

<sup>(2)</sup> See *The Union of South Africa, Government Gazette*, No. 2572 of September 30, 1938. The Law has retroactive effect as from the entry into force of the Marketing Act (No. 26 of 1937). For a criticism see the reports of the Secretary of State for Agriculture, Dr. VILJOEN, and the Secretary of the Meat Control Board, J. R. McLOUGHLIN, together with the reply of Prof. RICHARDS in the *South African Journal of Economics*, September 1938, pp. 280-312.

<sup>(3)</sup> See the *Government Gazette* No. 2537 of July 17, 1938. Compare description of contents in the May 1938 number of this Chronicle.

the beginning of the season, so that ultimately the revenues of the Board proved insufficient for the payment of both the export subsidies and the premiums to the farmers, with the result that it became necessary to appeal for the assistance of the State.

As a harvest of about 30 million bags is expected for 1939 with an export surplus of 15 million bags, whilst home consumption only amounts to some 5 or 5.5 million bags, and prices on the world market are falling, it clearly became necessary to set up a new system for the collection of the internal levies and the payments to producers and exporters.

Under the new maize plan, known as the "Mealie Control Scheme" <sup>(1)</sup>, the exporter no longer receives any specially calculated export subsidies, but the Board restores him the amount of the levy for the same quantity of maize when bought from the producer. Only such dealers as are registered with the Board are allowed to buy maize from the farmers. The Board retains the right to subject maize exports to quotas by the grant of permits. The Maize Levy Fund receives in addition to the already mentioned levy a small processing tax. The surplus remaining to the Board at the end of the season when all payments to exporters have been made is paid out to the maize growers by the Board in the form of premiums calculated on a sliding scale according to the amount sold by the producer. However, it is intended to fix an upper limit above which the grower is no longer entitled to such premiums. A further innovation in favour of the small farmers, who must mostly sell their produce already at the beginning of the season, empowers the Board to pay such growers in advance a certain fraction fixed at its own discretion, of the premiums which will be due to them within the course of the same financial year already at the time when they affect their sales. Growers in the Native Reserves do not receive premiums, as most of the coloured agriculturists produce only for their own consumption; but a special account will be opened in favour of the natives.

In short, the grower receives the net price prevailing in the world market, while home consumers pay a price above that of the world market.

*Wheat Control Scheme.* — The carrying out of the Wheat Control Scheme <sup>(2)</sup> is entrusted to the Wheat Industry Control Board, which was first set up in 1935 but has recently been reconstituted. It is composed of 18 members nominated by the Governor-General, amongst whom are to be found representatives of the wheat-growers and wheat-processors of every sort and also a representative of the consumers from the Consumers' Advisory Committee set up by the Marketing Act. The functions of the Board have, however, been somewhat limited in comparison with the preliminary plans of the first half of 1938. The powers to direct exports to particular foreign markets, to impose a levy on sales and to set up an equalisation fund have been abolished. The Board, however, imposes a unified levy on each bag of ground or otherwise processed wheat, which already at the time of the decreeing of the Scheme was fixed at 1 shilling per bag of 200 lb. Up to 35 bags per year for the use of the grower remain duty free. Registration is compulsory for all millers and other processors of wheat or wheaten products. The Board may require a report on wheat matters from anyone engaging in the production, processing or selling of wheat. Furthermore

<sup>(1)</sup> See the text of the law which entered into force on May 1, 1939 in the *Government Gazette* No. 2629 of April 21, 1939. Compare *Farmer's Weekly*, May 3, 1939, p. 535.

<sup>(2)</sup> *Government Gazette*, No. 2574 of October 5, 1938, entering into force on October 5, 1938. See *Farmer's Weekly*, October 12 and October 19, 1938.

the Board is empowered to use at its discretion the funds received for the development of the production and sale of wheat, to grant loans, to buy up and store wheat in any quantities thought fit, to fix maximum and minimum prices and to monopolize the right to purchase wheat. Already in November wheat producers were forbidden to sell their wheat to anyone but the Board. (1).

*Dried Fruit Scheme.* — The Dried Fruit Scheme (2) was enacted with only slight modifications in the form described in the May, 1938 number of this Chronicle. The director of the economic section of the Ministry of Agriculture, however, pointed in his annual report to the pressing necessity of a more closely knit organisation in order to restrict the excess production which had risen during the years of the revival, and to see to the improvement of the quality of the fruit. Last year in the principal foreign markets dried fruits from the Union were valued at 5 to 10 shillings per hundredweight (112 lb.) less than those from other producing countries (3).

*Tobacco Marketing Scheme.* — The Tobacco Marketing Scheme was also adopted very much in the form proposed last year (4). Owing to its closely-knit organisation tobacco indeed belongs to the most firmly established branches of Union agriculture.

A decision of the Board has prohibited further duty-free imports of Turkish tobacco, as there still remain considerable stocks of the home crop from last year.

*Meat Marketing Scheme* (5). — The Live Stock and Meat Industries Control Board set up in 1934 is to be expanded to 18 members, all to be nominated by the Governor-General. The Board levies a slaughter tax on cattle, sheep and pigs. Live animals which are imported into the Union for subsequent re-export and are slaughtered in the Union are exempt from this tax. Of the revenue thus accruing a certain percentage (60 per cent.) fixed by the Board and approved by the Ministry will be used for the payment of export subsidies. The Board is further empowered to pay premiums on quality to the producers of high-value slaughter-cattle for home consumption, and to grant breeders and associations of breeders loans up to a proportion of the export value to be determined by the Board. It can limit the right of sale for live animals and for the meat trade to possessors of a trading permit issued by the Board, and can introduce compulsory registration for the suppliers of live cattle to the districts under its control. For the registration of home and export prices an Export and Stabilisation Fund is to be created, but the Board is not, however, empowered to fix maximum or minimum prices.

*Chicory Roots Marketing Scheme.* (6). — The control of the marketing of chicory roots, the production of which is limited to three adjoining districts, is reserved exclusively to the producers. Only planters elect the Board or are eligible for election to it.

(1) *Government Gazette*, No. 2585 of November 11, 1938.

(2) Text in the *Government Gazette*, No. 1962 of October 28, 1938. Entered into force on December 1, 1938.

(3) Annual report of the Chief of the Division of Economics and Markets, Dr. GROSSKOPF in *Farmer's Weekly* January 11, 1939, p. 1145.

(4) Text in *Government Gazette*, No. 2617 of March 21, 1939, entering into force on April 1, 1939. See the description in the May 1938 number of this Chronicle.

(5) Only provisionally approved by the Minister. For text see the *Government Gazette*, No. 2580 of October 28, 1938.

(6) Only provisionally approved. See the *Government Gazette*, No. 2583 of November 4, 1938.

The financial powers and rights of control are of the usual type. The Board is empowered to impose a levy per 100 lb. of chicory roots produced according to a sliding scale as also export duties, to introduce compulsory registration for producers and to limit the sale of the product through certain authorised channels.

*Schemes in preparation.* — The enactment of marketing schemes for dairy products <sup>(1)</sup> has so far had to be postponed. Difficulties arise mainly owing to the over-expansion of the dairy industry during the last 10 to 15 years, as a consequence of the large-scale speculation resulting from the especially wide gap between summer and winter production and prices. The Dairy Industry Control Board founded in 1930 proved unable to check this over-expansion, despite its prohibitions on new entries into the industry. Within the framework of the new marketing plans the struggle seems to be centering around the authorisation of the Board to limit the number of uneconomic and superfluous concerns by compulsory purchase. The productions of dairy butter has risen by 10 million lb. from 1930 to 1938. The portion of the selling price to consumers received by the producer amount to 50-55 per cent. in the case of butter, to 30-40 per cent., for cheese, and (in Natal) to 25-30 per cent. for milk.

The outline of a marketing scheme for fruits coming from deciduous trees <sup>(2)</sup> was passed to the Deciduous Exchange, that for a wool marketing plan to the Wool Council <sup>(3)</sup>.

### Miscellaneous:

*Reduced transport charges.* — The Finance Minister in his budget speech of March 1939 promised for the ensuing financial year a reduction in railway freight charges for agricultural products, the railways to be compensated by a grant of £800,000 from the State.

*Loans for fruit production.* — Since the summer of 1938 loans up to £150 and repayable within five years have been granted by the State to impoverished farmers in order to maintain fruit farms which have become unprofitable since 1937. The loans for the development of export comprised within the £150 will not be paid in cash but in the form of orders on the Railways and Harbour Administration <sup>(4)</sup>.

*Agro-economic Survey.* — The agro-economic survey carried out by the State is to lead to a division of the Union into 22 agricultural districts, each such district being composed only of areas of the same climate and type of soil. Only when this undertaking has been completed will it be possible to aid farmers with better advice and to check the flight from the land. The survey was begun some years ago and has as yet been applied to 11 districts.

*Purchase of land for coloured people.* — At the opening of Parliament in the beginning of February the Governor-General announced the coming revision of the Native Trust and Land Act of 1936. Lands were already being bought for the natives in order to abolish the small scattered reserves and to compensate the natives with lands elsewhere, thus creating several large contiguous areas for natives and for whites.

## VEGETAL PRODUCTION

### World wheat production in 1938 and the present condition of winter wheat crops.

Since the publication of the December Crop Report and Agricultural Statistics, some new and many revised estimates have been received by the Institute. These result in slight increases in the totals of production of the various continents given last month.

In Europe the only countries which had not published their 1938 estimates of production, namely Ireland and Northern Ireland, issued them this month. Their figures show a very large aggregate crop, definitely better than last year and the average, due to both an increase in acreage and a high yield per acre.

One of the most important revisions is that of Yugoslavia where production is put at 10.4 million bushels higher than the first forecast, and thus would be one of the largest wheat crops in this country. Another modification is in the Romanian crop which is now estimated at a slightly lower figure (180 against 181.5 million bushels). Thus, of the four Danubian countries, three report productions in 1938 which are considerably higher than their former records and the fourth, namely Hungary, has a crop which is close to the record of 1928. The aggregate wheat production of Europe, which each month is raised by new estimates, has again been increased during January by 7 million bushels over the total given last month. European production in 1938, accord-

ing to these latest estimates, is about 91 million bushels higher than the former record crop of 1933.

In North America the final estimate of production in Canada, recently published, shows only a slight increase on the figure published in November. Thus the country which is normally the world's largest exporter, after five years of poor crops, has had a large crop, which however, is still well below the average of the ten years 1923 to 1932.

As a result of this revision the aggregate production of North and Central America is raised by about 3 million bushels on last month's figure and is one of the largest crops of the last 15 years, but is well below the three record years 1927, 1928 and 1930.

In Asia, production in Syria is slightly higher than had been calculated on the basis of the acreage and the yield indicated by crop condition. The aggregate production in Asia is thus 4 million bushels higher. This continent (excluding China) thus attained in 1938 a record figure of wheat production.

In Africa, Algeria has revised her former estimate with a considerable increase (from 32.1 to 33.7 million bushels). The second estimate of the Union of South Africa is practically unchanged from the former estimate. Aggregate production in Africa is thus raised from 132 to 136 million bushels, which is about an average figure.

Of the South American countries, Uruguay has cabled to the Institute her first wheat crop forecast, which, though definitely below the average, is somewhat higher than last year's figure. This year's excellent prospects have not been fully realized owing to late frost and hail. In Chile about an average crop is expected. In Argentina the season continued to be favourable for threshing and the ripening of late crops. It is believed that the first crop forecast, published last month, may be slightly increased. The aggregate production of this continent is thus raised from 371 to 375 million bushels. This figure is second only to the record of 1928 (400 million bushels).

Australia finally cabled to the Institute on January 19 that harvesting, which took place in favourable conditions, was finished in most of the wheat growing areas. Results exceed forecasts in Western Australia. In South Australia and New South Wales the specific weight of the grain is high. It is confirmed that yields in Victoria are very low. In New Zealand the wheat crop suffered from drought. Nevertheless a rather larger crop is expected than had been hoped for a month earlier. The aggregate production of Oceania is thus raised by about 4 million bushels from 147 to 151 millions, but it is still well below the average.

The estimates and revisions received by the Institute during January thus involve only slight modification of the totals for the various continents but all these revisions are in an upward direction: an increase of 7 million bushels in the estimate for Europe, of 3 millions for North America and of 4 millions for South America, Asia, Africa, and Oceania. Thus the world total of wheat production in 1938 is raised by 26 million bushels on last month's estimate.

*World wheat production (1)*  
(million bushels).

(1) Not including China, Iran and Iraq. — (2) Not including U S. S. R.

This figure of world production in 1938, (which excludes the U. S. S. R., China, Iran and Iraq) is a record. It is more than 430 million bushels or 11 per cent. above the previous record of 4,040 millions in 1928.

### World wheat trade in 1938-39.

The latest official statistics of world net exports of wheat refer to the first four months of the season from August 1 to November 30. Trade was fairly lively in the first quarter but fell off in November and was even a little below the level of November of last season. Nevertheless aggregate world exports of wheat in the first four months of 1938-39 show an increase of about 31 million bushels on the corresponding total of last season. The increase is particularly marked in the case of Canada, where there are large supplies from the 1938 crop. The United States exported approximately the same quantity as in the corresponding period of last year, while Argentina and Australia considerably increased their exports and thus succeeded in disposing of the greater part of their old crop stocks before the new harvest. The quantity marketed by the Danubian countries, in spite of the very large exportable surplus available in these countries, only shows, in this first part of the season, a slight increase on last year, but they will tend to develop as the season advances. Soviet exports, which were very heavy in the first three months, fell sharply in November and do not seem likely to recover in the next few months.

The average of exports for the first four months of the season—51 million bushels per month—is rather higher than we had forecast last October as the average for the 1938-39 season. We then forecast average monthly exports of 45 million bushels. It is possible that our October estimate may have

\*) Aggregate net exports of the normal exporting countries (possible net imports into certain of these countries are not deducted from the totals).

1) Forecast October 1938. — 2) Net exports adjusted in accordance with the monthly variations in stocks of Canadian wheat in the United States and stocks of United States wheat in Canada. — 3) Bulgaria, Lithuania, Poland and Yugoslavia. — 4) Iran, Iraq, Turkey, Chile, and Uruguay. — 5) Net imports.

to be raised slightly but we do not believe that it is opportune to do so yet, but we shall reconsider the figure next March, when the data are more complete.

The considerable increase in the net imports of European countries during the first quarter of the season from August to October continued during November and the aggregate of the first four months showed an increase of 29 million bushels on the corresponding period of last year. Of this increase 9 millions are ascribed to the United Kingdom and Ireland, 8 millions to Germany and the remainder is distributed more or less proportionately among the other importing countries of the continent; only Belgium and France show small relative decreases.

Imports of the Extra-European countries continued low and were hardly larger than last season.

#### Area and condition of wheat sowings for harvest in 1939.

The information hitherto received by the Institute on the wheat sowings for harvest in 1939 is still too vague and fragmentary to justify definite conclusions but it will serve to give some general indications of the likely changes in the wheat area.

*Net imports of wheat into Europe (including flour in terms of wheat) \*).*

\* ) Aggregate net imports of normal importing countries, after deduction of exports, if any.

1) Forecast October 1938. — 2) After deduction of net exports of 1 million bushels from Czecho-Slovakia. — 3) After deduction of net exports of 1 million bushels from Sweden. — 4) After deduction of net exports of 1 million bushels from Sweden and 0.4 million bushels from Czecho-Slovakia. — 5) After deduction of net exports of 9 million bushels from Czecho-Slovakia. — 6) Denmark, Estonia, Finland, Latvia, Norway and Sweden. — 7) Czecho-Slovakia, Spain, Portugal, Albania, Malta, etc.

In Europe the autumn was favourable in nearly all parts for winter sowings which were practically completed at the beginning of the new year. Despite the low prices ruling on the world market, the internal prices in both importing and exporting countries were sufficiently attractive to maintain and, in some cases, to increase the cultivated areas, all countries having taken steps to protect the purchasing power of the growers. Since both physical and economic factors tended in the same direction, an increase is probable in the European wheat acreage. This increase, however, should only be moderate.

After a mild autumn with rather plentiful moisture in the latter part, winter suddenly set in practically over the entire continent with severe cold accompanied and followed by heavy snowfalls, which in most cases afforded sufficient protection for the sowings. Where the snow cover was insufficient or where the soil had frozen before the coming of snow, the damage caused by the cold wave of the last decade of the year was substantial. This was especially the case in the north of France and in Belgium. However, on the whole, losses seemed neither widespread nor severe. In the first half of January temperatures rose and weather became mild and wet in all parts, causing a premature thaw and leaving the fields unprotected against a sudden return of wintry conditions.

Although the December frosts caused some local damage, they were helpful in clearing land of weeds and insects and, in some cases, in checking over-rapid growth of the wheat. At mid-January the crops in most regions were satisfactory, as at the same period last year.

1) Sowings at January 1 1939.

In Russia, where the acreage seems to be similar to last year's, conditions resembled those in eastern Europe; there was severe cold with much snow in the second half of December and a return of milder weather in the first half of December. The crops began the winter in satisfactory condition and seem to have stood up well to the frosts of the end of the year. There was some fear, however, that the snow cover in some southern districts was too light to give adequate protection.

An estimate of the winter sowings in the United States, indicating a reduction of 18 per cent. on last year, was published last month. The Canadian winter wheat crops, of minor importance compared with spring wheat, show a decrease of 2 per cent. from 1938 and an increase of 20 per cent. on the average. The condition of the crop in the United States, which varied from one section to another but, on the whole, was rather mediocre early in January, improved somewhat in the first half of the month with the advent of rain but precipitation was uneven and insufficient in the areas most affected by the drought.

In India, an appreciable reduction in sowings is expected owing to prolonged drought which was relieved only locally, the general situation worsening appreciably. The prospects for the March-April crop are definitely not as good as those at the same period a year earlier.

Crops are generally satisfactory in the countries of the Near East.

In North Africa, where the season has been generally favourable for sowing, a rather considerable increase in sowings is in prospect. Tunisia expects an

increase of about 30 per cent. on last year. The crops in Tunisia, Algeria and Morocco benefited from good rains and are generally in satisfactory condition. Crops in Egypt grew regularly.

G. CAPONE.

## Current information from various countries on wheat, rye, barley and oats.

### Europe.

*Germany:* The Central Statistical Office has just published final figures of acreages in Germany in 1938 excluding Austria. On the whole, only minor revisions of the former estimates are made. The final figures are: wheat 5,037,000 acres against a first estimate of 4,983,000; rye, 10,533,000 acres against 10,479,000; barley 4,133,000 acres against 4,119,000; oats 6,666,000 acres against 6,696,000; spelt 138,000 acres against 151,000; meslin 1,460,000 acres against 1,453,000. Provisional figures are retained in the tables, as final figures for Austria are not yet available.

*Belgium:* Conditions were dry during the first half of December. There were heavy rains at the end of the month and temperatures were mild.

*France:* The first two decades of December were mild with sufficient rainfall. These conditions enabled all seasonal work to proceed well and stimulated growth even to an excessive extent in many cases. In the third decade there was a sudden, sharp drop in temperature, followed by snow. In the north, however, including the northern Paris basin, snow only fell after several days of severe frost. The thaw began on December 31 and continued in the first decade of January, with a slow, steady rise in temperature. Night frosts continued until the end of this period in most parts.

The growth of cereals, particularly wheat, had been exceptionally strong up to December 20, but the mild temperature had also encouraged the spread of weeds. The heavy frost of the last decade does not seem to have affected the wheat crops that were covered with snow, namely in the centre, west, east and south of France. In fact, the frost had the good effect of destroying many of the weeds and certain pests, such as field-mice and slugs. But in the Paris basin, the north and the northeast, the frost seriously damaged crops before they were covered. Wheat sown after alfalfa was particularly affected. Several agricultural experts have estimated that the loss in a number of districts amounts to two thirds or three quarters of the sowings. Official estimates of the damage have not yet been issued. Of minor cereals, rye seems to have resisted the frost well but oats were very seriously affected. It is officially estimated that in a number of cases, particularly in the whole of the north, crops have been entirely destroyed.

The area under meslin in 1939 is estimated at 162,100 acres against 162,300 acres in 1938 and an average of 168,800 acres in 1933 to 1937: percentages: 99.9 and 96.0.

*Greece:* In spite of rather dry weather in the first two decades of November the sowing of cereals continued throughout November. At the middle of December sowing was finished everywhere in rather favourable conditions. An increase in acreage sown of from 15 to 30 per cent. is forecast in the provinces of Serres, Tricalla, Messina and Corfu. Floods due to the heavy rain of December damaged cereal crops. The Agricultural Bank took urgent steps to repair the damage, which however does not seem very severe.

*Hungary:* In the four weeks December 14 1938 to January 11 1939, the weather was rather cold and precipitation, mainly in the form of snow, was above the aver-

## NOTES FOR TABLES OF WHEAT, RYE AND MESLIN.

1) The years indicated are those of the harvest, single years referring to the Northern Hemisphere, double years to the Southern. — \*) Countries not included in the totals. — §) In calculating the totals account has been taken of the probable area cultivated in some countries for which estimates of production are available but not those of area. — w) Winter crop. — s) Spring crop. — 1) Including Austria. — 2) Estimated on May 1. — 3) Provisional estimate. — 4) Including spelt. — 5) Area provided for in the Plan. — 6) Average of three years. — 7) Average of four years. — 8) Including Tigris. — 9) Cultivation by Europeans only. — 10) Area sown. — 11) Average of two years.

age. During the severe frosts of December 17 (10° to 14° F) and December 18 (3° to 8° F) fields were covered only by a thin layer of snow. Winter cereal sowings began the winter in satisfactory condition.

*Ireland:* The first half of December was almost continuously wet but mild. There was a spell of severe frost and snow from December 17 to 24 but subsequently it was mild again. Sowing was not practicable, but October-sown cereals germinated satisfactorily. The cold spell did not seriously affect crops.

*Italy:* The first half of December was exceptionally mild, but the second half was intensely cold. The cold spell had the good effect of checking the growth of winter cereals which in some parts of Italy were too forward. At the end of the month the sowing of winter wheat was still in progress in some areas but was nearing completion.

*Latvia:* During the first half of December weather was mild, the cold beginning in the second half. These were rains during the first half and at Christmas there

## Area and production of barley.

†) The years indicated are those of the harvest, single years referring to the Northern Hemisphere, double years to the Southern. — \*) Countries not included in the totals. — §) In calculating the totals account has been taken of the probable area cultivated in some countries for which estimates of production are available but not those of area. — w) Winter crop. — s) Spring crop. — a) Including Austria. — x) Area sown. — 2) Barley and meslin. — 3) Area provided for in the Plan. — 4) Average 1934 to 1936. — 5) Average 1932 to 1935. — 6) Including Tigris. — 7) Area harvested. — 8) Cultivation by Europeans only. — 9) Average 1933/34 to 1936/37.

was snow which gave the fields a thin cover. The condition of winter wheat at the beginning of January was average according to 32.1 per cent. of the crop reports, above average according to 65.6 per cent. and below average according to 2.3 per cent. Corresponding figures for rye were 23.1 per cent., 75.4 per cent. and 1.5 per cent.

*Lithuania:* During the first half of December, weather was mild with some precipitation. At the beginning of the second half of the month frost set in and continued to the end. The temperature fell to 2° F below zero. The snow fell on frozen soil, a favourable factor for the wintering of the crops.

*Poland:* According to the Central Statistical Office of Poland, the long, warm and moist autumn was favourable both for the growth of winter cereals and for preparation work for the spring sowings. The winter cereals began the winter well developed and well rooted. The crop condition of winter cereals, compiled from the reports of 3,750 crop reporters, was as follows:—

	15-XII 1938	15-XI 1937	15-XII 1937
Wheat . . . . .	3.4	3.4	3.6
Rye . . . . .	3.6	3.5	3.8
Barley . . . . .	3.4	—	3.5

The figures show that condition on December 15 was practically what it was on November 15 but slightly better than it was on December 15 1937. The severe frost of the first half of December, however, may have done rather considerable damage to the plants which are well grown but without snow cover.

*Romania:* On January 13 the condition of winter cereals was good. The snow cover was adequate throughout the country at that date. The situation was also good on January 20, although rain and a warm spell had melted the snow in almost all parts. Snow is required for protection of the young plants.

*United Kingdom:* In the first half of December the mild weather of November continued, with gales in the west and north of England and in Scotland. The second half was very cold with heavy falls of snow. Mild conditions returned towards the end of the month. Conditions were not favourable for cultivation or sowing, but work is still fairly well in hand except in the north and parts of Wales. Germination has been good and plants are generally strong and healthy. January, particularly the third week, was exceptionally wet.

*Yugoslavia:* According to the most recent estimate, the area cultivated to spelt in 1938 was about 41,100 acres against 37,400 in 1937 and 41,700 on the average of the five years ending 1936; percentages, 109.9 and 98.5. The corresponding production is estimated at about 248,600 centals against 255,100 and 285,000; percentages, 97.5 and 87.2.

*U. S. S. R.:* About the middle of December, following mild weather, there was a sudden drop in temperature of 25° to 35° F. to a level about 10° to 15° F. below the long-term average in the west of the European Territory and about 25° F. in the eastern part of the Territory. On December 16 the wave of cold had spread all over the south. The lowest temperatures recorded were 4° below zero F. in eastern Ukraine, 9° to 14° above zero F. in North Caucasus, 7° to 18° above zero F. in the Crimea, 13° to 18° below zero F. in the Volga region and as low as 41° below zero F. in the northeast. In the centre these temperatures were maintained for 5 to 7 days and in the south and west for 4 to 5 days. The current of cold air coming from the North meeting the warm moist air caused precipitation. In the

centre, however, the snow cover was so light as not to be continuous, whereas in North Caucasus there was deep snow. In the second decade the snow covered the fields in the greater part of the country, but in many areas the depth was slight and variable, while in the southeast there were fields completely uncovered. In many areas of the centre the sudden, sharp drop in temperature found the fields little covered by snow. The ground is frozen to a considerable depth in the south of the Union the snow fell on frozen ground. In the third decade of December the temperature remained constantly low. There was frequent precipitation, but there were still parts of the southeast without a snow cover. In the Asiatic Territory it was very cold and there was a heavy snowfall.

No information on crop condition is available except for Ukraina. On December 15, at the moment when growth was checked the condition of winter wheat and rye varied on the whole from good to excellent.

#### America.

*Argentina:* The weather of December was favourable on the whole for the threshing of wheat and for the growth of the late crops which were in fair conditions at the beginning of January.

*United States:* The total wheat harvest of 1938, at 558,481,000 centals (930,801,000 bushels), was 6.3 per cent. larger than the 1937 crop, 50.7 per cent. above the average outturn of the five years 1932 to 1936 and the third largest of the post-war crops.

The cereal yields obtained in 1938 are shown below with comparisons.

	1938	1937	Average 1927-36	1938	1937	Average 1927-36
	centals	per harvested acre		bushels	per harvested acre	
All wheat . . . . .	8.0	8.2	8.1	13.3	13.6	13.5
Winter wheat . . . . .	8.3	8.8	8.7	13.8	14.6	14.5
Spring wheat . . . . .	7.1	6.5	6.7	11.9	10.9	11.1
Rye . . . . .	7.7	7.3	6.3	13.8	13.0	11.3
Barley . . . . .	11.5	10.6	10.1	24.0	22.1	21.0
Oats . . . . .	9.5	10.5	8.7	29.7	32.9	27.1

The harvested area of buckwheat in 1938 was estimated to have been 453,000 acres compared with 426,000 acres in 1937 and with an average of 454,000 acres in the years 1932 to 1936; percentages, 106.3 and 99.7. The production was estimated at 3,341,000 centals (6,682,000 bushels) against 3,382,000 centals (6,764,000 bushels) in 1937 and an average of 3,821,000 centals (7,643,000 bushels); percentages, 98.8 and 87.4. The area sown to winter wheat in the autumn of 1938 (46,173,000 acres) is in sharp contrast with the very heavy autumn seedings of 1936 and 1937 and indicates a tendency to return to an acreage about equal to average. This is undoubtedly associated with lower wheat prices received for the 1938 crop and with the Agricultural Adjustment Administration quotas for the 1939 crop. In Indiana, Illinois and parts of adjoining States the dry fall interfered with seedings and the acreage is below average. Seedings are, however, somewhat above average in Kansas, Nebraska and South Dakota where recent summer droughts have caused a shift from maize to winter wheat; also from Colorado into Montana where wheat gave an unusually good

yield in 1938. Acreage also exceeds average in a less important producing area extending from Kentucky and North Carolina southward.

The condition of winter wheat on December 1 was 72 per cent. of the normal compared with 76 per cent. a year earlier. Conditions were generally poorest in the Great Plains area from Nebraska southward. In this area early moisture conditions were more favourable than in recent years, resulting in somewhat better subsoil conditions. With subsequent dry weather, however, surface moisture was becoming exhausted by December 1. In parts of the Central Plains area much late seeded wheat had not yet germinated. Soft winter wheat in the Atlantic States and in some East North Central States showed a better condition than in 1937, particularly in Illinois, Missouri and Iowa. In the Pacific Northwest and in California the condition of winter wheat was close to average. It is expected that abandonment of sown acreage will be above average and will probably be between 20 and 25 per cent. The acreage of rye sown for all purposes in the autumn of 1938 (including an allowance for spring sown rye) is 7,171,000 acres which is an increase on last year and on the average. Increases in sown acreage were quite general throughout the country. The only important rye producing State to show a decrease from last year was Wisconsin.

The condition of rye on December 1 was 76 per cent. of the normal compared with 74 per cent. on December 1, 1937. Condition was better in most of the Northern Great Plains area and east of the Rockies. This was partially offset by lower condition in much of the eastern Maize Belt and in the Pacific Coast States.

During the following weeks conditions were favourable on the whole east of the Mississippi but generally unfavourable in the west.

Early in January there were alternations of freezing and thawing and the crops were adversely affected where there was no snow cover. East of the Mississippi favourable conditions continued. From the Mississippi to the Rockies there was no material change except in the western belt where there was an increasing need of moisture. Conditions on the Pacific Coast were favourable.

In the second week of January many sections of the winter wheat belt received moisture which was especially helpful in the southwest but in parts precipitation was too light to bring material benefit. Good rains fell in southern Kansas but in the rest of the State there was further deterioration. Partial good rains fell in the northwest. Elsewhere rainfall was insignificant and there was some deterioration on late-sown and poorly prepared land. Conditions were still favourable on the Pacific Coast.

*Uruguay:* Harvesting was proceeding early in January in good conditions but late frosts and hail caused some damage. The first estimate of the 1938-39 crop shows a decrease of about 8 per cent. from last year but an increase of 38.8 per cent. on the five-year average.

#### Asia.

*India:* In the Punjab in the four weeks ending January 9 the weather was dry save for light rain in the week ending December 26. More rain was needed. Crop condition remained average in irrigated areas and below average in unirrigated areas. In the Central Provinces dry weather was also experienced and showers were needed. Wheat had suffered in Jubbulpore.

*Palestine:* It is reported that the 1938 wheat crop was of very poor quality owing to a widespread attack of rust. Figures for the area sown this year to cereals are not yet available. Rainfall in December was sufficient but not proportionately

distributed; towards the end of the month the need for more rain was starting to be felt. Night temperatures during the second fortnight of December were low as compared with previous years. Sowing was rather on the late side. Germination was reported to be normal and the crop condition generally good.

#### Africa.

*Algeria:* December was generally wet and cold, particularly at the end of the month. The temperature was below freezing on high ground. Snow and hail fell. Sowing was interrupted by the bad weather but was fairly well in hand on European farms, except in certain parts of Oran. It was however behind on native farms. Germination took place normally on early sown lots and tillering proceeded in good conditions. As a result of the rain weeds have spread. On the whole, condition of crops at the beginning of January was considered satisfactory.

*Egypt:* Late sowing of wheat was effected by the middle of December in Lower Egypt and by its last days, in Upper Egypt. Sowing is considered about 7 days later in Lower Egypt and 10 days later in Upper Egypt than last year, owing to the delay in picking cotton and pulling up stalks. Manuring and watering of the crop were done before the advent of the drought period which commenced in the last days of the month. Growth was satisfactory owing to the favourable weather conditions. Sowing of barley was over at the end of the third week of December and was about one week later than last year. Watering was general before the winter closure of canals, and manuring of certain fields was also completed. Growth is satisfactory.

*Union of South Africa:* The weather during November was very favourable with plenty of rain in the Southwest and South Coast areas of Cape Province. Harvesting of wheat was in progress and yields were excellent in the Southwest. In the Orange Free State wheat crops were severely damaged by hail and sudden frost about the middle of November. Nevertheless, good yields were still to be hoped for.

#### Oceania.

*Australia* (Cable of January 19): The wheat harvest in Western Australia is almost finished; results exceeded expectations. In South Australia harvesting is proceeding in very good conditions while in New South Wales it is complete; the grain is heavy in both States. In Victoria cropping is well forward but the yield is expected to be much lighter than last year's.

#### Current information on maize.

*Argentina:* The maize crop was in average condition at the beginning of January. Lack of rain was the cause of deterioration in several parts of the country.

*United States:* The yield of maize per harvested acre of 15.5centals (27.7 bushels) has only been exceeded during the past 15 years by the 1937 yield of 15.8 centals (28.3 bushels). The quality of the crop was above average except in parts of the Northwestern and Western States.

*Uruguay:* The condition of the maize crops during the first decade of January was considered good but rain was needed.

## Area and production of maize.

†) The years indicated are those of the harvest, single years referring to the Northern Hemisphere, double years to the Southern. — \*) Not included in the total. — §) In calculating the totals account has been taken of the probable area cultivated in some countries for which estimates of production are available but not those of area. — 1) Including Austria. — 2) Estimation for the old territory. — 3) Area sown. — 4) Maize sown in spring. — 5) Maize sown in summer. — 6) Crop grown alone. — 7) Mixed crop. — 8) Average 1934 to 1936. — 9) Area fixed by the plan. — 10) Average 1932 to 1935. — 11) Maize for all purposes. — 12) Maize harvested as grain. — 13) Including Tigris. — 14) *Nili* maize. — 15) *Seft* maize. — 16) Cultivation by Europeans. — 17) Maize and sorghum. — 18) Area harvested. — 19) Cultivation by natives.

*Netherlands Indies: Java and Madura.* — The Department of Agricultural Statistics of the Central Statistical Office communicates the following details on the maize area:—

	1938 acres	1937 acres
Area harvested in November . . . . .	372,100	268,900
Area harvested from January 1 to November 30 . . . . .	4,518,400	4,680,500
Area of standing crops at the end of November.	2,466,900	2,086,800

*Indochina:* Maize harvesting was finished in Thanh-hoa in Annam in October; the average yield was only 9 centals (16 bushels) per acre. The new sowings are generally good in appearance but floods have damaged some areas. The same is true of Cambodia where the September sowings on the banks of the Mekong were destroyed in October by the overflowing of the river. Sowings on red soils, however, give promise of a good crop.

*Egypt:* Harvesting of autumn maize was finished during December except in a few patches in Assiut, Quena and Asuan Provinces. The work is active in husking and storing. Harvesting of autumn millet was terminated in all localities except in Quena and Asuan where harvesting was progressing in the last cultivations. According to the first estimate, the total area cultivated to millet in 1938 is 404,000 acres, an increase of 21.8 per cent. on 1937 and one of 23.9 on the five-year average 1932-36; total production is estimated at 10,361,000 centals (20,722,000 bushels), an increase of 15.6 per cent. on 1937 and one of 18.5 on the five-year average.

*Union of South Africa:* Practically all the maize-growing areas of Orange Free State, Transvaal and Natal experienced good rains in November. But towards the middle of the month there was a sudden cold spell with frost and hail. There were also strong winds in Natal. Young standing maize was damaged in Natal. In Transvaal, however, the crop was still promising. A fair amount of ploughing and planting had been done in the Orange Free State.

### Current information on rice.

*United States:* The 1938 rice crop of 23,536,000 centals (52,303,000 bushels) is the second largest rice crop produced in the United States and only 2 per cent. below the record crop of 1937. The average yield was 22.0 centals (49.0 bushels) per acre.

*Burma* (Telegram of 17 January): According the fourth report on the rice crop of 1938-39, the area sown is estimated at 12,809,900 acres, an increase of 0.1 per cent. on last season's fourth estimate of 12,798,200 and one of 1.5 per cent. on the corresponding average of 12,626,100 acres for the five years ending 1936-37. This is larger than any corresponding estimate since 1933-34. The area destroyed is now estimated at 225,700 acres, a decrease of 15.4 per cent. on the fourth estimate of 266,800 acres last season and one of 30.7 per cent. on the corresponding average of 325,900 acres.

Though there has been a considerable increase in the damaged area since the previous month's report, this figure remains the lowest of recent years. In the result, the fourth estimate of area to mature is 12,584,200 acres, an increase of 0.4 per cent.

1) Sown area. — 2) Area planned. — 3) Fourth report. — 4) Area to mature. — 5) Second report. — 6) First report.

on the corresponding estimate of 12,531,400 for 1937-38 and one of 2.3 per cent. on the corresponding average of 12,300,200 acres. It is the highest estimate of the period and above last season's final estimate.

The fourth estimate of production is 13,690 million pounds of white rice and derivatives, an increase of 14.7 per cent. on the corresponding estimate of 11,933 last season and one of 10.2 per cent. on the corresponding five-year average of 12,422 million pounds. This is easily the highest estimate of the period.

The estimate of export surplus has been raised from 7,840 million pounds of white rice and derivatives to 8,064 million pounds, a figure 16.1 per cent. above the final forecast of last season's exports and 8.4 per cent. above the average of 7,437 million pounds actual exports for the five seasons ending 1936-37. It was exceeded, however, by the exports from the 1933-34 crop.

*India:* In Bengal light scattered showers fell in the week ending January 11. Harvesting of winter padi was being completed. Crop prospects were favourable. In Orissa no rain fell in the month ending January 9; harvesting of winter padi was going on and standing crops were in fair condition. Similarly in Bihar no rain fell during the same period. Crops were in fair condition save in Saran, where flooding had occurred. In Assam on January 16 the weather was reported to have been seasonable and crop prospects to be fair.

In the Central Provinces, where the sky had been clear during the month ending January 7, threshing was going on.

In Madras there was light to moderate rain in the south and light rain in Malabar. Sowing of padi was proceeding. On January 7 the condition of crops was fair except in the Circars and the Carnatic, where they were withering owing to the failure of the northeast monsoon. In the Circars extensive cyclone damage had also occurred.

*Netherlands Indies: Java and Madura.* — The Department of Agricultural Statistics of the Central Statistical Office communicates the following details on the rice area:—

	1938 acres	1937 acres
<i>Area harvested in November: —</i>		
Wet padi . . . . .	233,000	252,000
Dry padi. . . . .	6,400	1,200
<i>Area harvested from January 1 to November 30:—</i>		
Wet padi . . . . .	8,627,300	8,444,200
Dry padi. . . . .	956,600	960,800
<i>Area of standing crops in the end of November:—</i>		
Wet padi . . . . .	1,112,200	1,030,000
Dry padi . . . . .	558,000	570,600

*Indochina:* The situation of the rice crops in October in the various regions, except Laos, was as follows.

In Annam, the eighth-month rice harvest, hindered by the floods of the end of December reported in the last issue of the Crop Report, was finished everywhere about the middle of October. Yields were satisfactory except in the far south. Tenth and twelfth-month rices benefited considerably from rains; they were good in appearance everywhere except in the south and far south, where prolonged submersion had an unfavourable effect. Preparatory work for third-month crops began; the beds looked well and in some places planting out had begun.

In Cambodia, as a result of rains, sowing and transplanting went forward in October. On high, easily drained-fields, growth was satisfactory. Floating rice looked well generally. Some fields were flooded by the rise of the Mekong; damage was limited and largely offset by the good growth of other fields and by the increase in the cultivated area.

In Cochinchina the October rains were beneficial. Earing of early, and mid-season rice was normal; in many provinces the crop is expected to be larger than last year's. The growth of main-season rice was excellent. Earing of floating rice occurred in good conditions. Harvesting of *samo* rice and third-month rice was going on in several provinces.

In Tonkin there was much rain in October and a typhoon on the eighth and ninth of the month. Damage, however, was limited. It was considerable only in the rather low-lying areas where, drainage is always difficult in the rainy season and where the crops are uncertain. Harvesting of tenth-month rice was finished; yields were generally distinctly above those of last year. Harvesting of mountain rice was finished with satisfactory yields. Flowering of main season rice was over. Sowing of fifth-month rice was effected in many places.

*British Malaya:* In November the west coast padi areas continued to look very promising. In Pahang and Kelantan, however, weather conditions throughout the season had not been so favourable. In Negri Sembilan the recent spell of dry weather was said to have caused serious damage to fields which are entirely dependent on rainfall; in many parts of this State planting was carried out late owing to unfavourable conditions. In Southern Selangor most of the padi was ripe, and much had been harvested.

It was reported that this season's crop had so far been reasonably free from serious attacks of disease. Rat damage also had been slight.

### Current information on potatoes.

*Area and production of potatoes.*

\* Not included in the totals. — s) Early potatoes. — t) Late potatoes. — 1) Under 1,000 acres. — 2) Average 1932 to 1935. — 3) Average 1935 and 1936.

*France:* The severe cold of the last decade of December did considerable damage to the insufficiently protected potato silos.

*Argentina:* Potatoes were still being planted in the south of the province of Buenos Aires in December. The area in this province is expected to be smaller than last year's. Lifting of earlies gave generally satisfactory yields except in parts of Santa Fé and Santiago del Estero.

*United States:* The yield per acre of potatoes in 1938 was 73.7 centals (122.8 bushels) compared with 74.5 centals (124.2 bushels) in 1937 and with a ten-year (1927-36) average of 66.4 centals (110.6 bushels).

*Algeria:* Early potatoes were planted in December. In Oran it seemed likely at the end of the month that the area planted would be much larger than last year's. Cold weather and hailstorms did some damage to the crops.

## Sugar prices in 1938 and beet sugar production.

The markets considered in this brief review of price movements in 1938 are New York, London, Surabaya, Prague, Paris and Magdeburg. The prices given in the table are Thursday quotations.

In 1937 sugar prices at New York declined gradually with only slight fluctuations until, at the end of December, they touched one of the lowest levels of the year. The downward tendency continued almost throughout the first six months of 1938 under the influence of an output exceeding consumption requirements which contracted slightly in 1937-38. Other occasional and temporary factors were the Government's declaration in the first days of March that sugar prices were satisfactory and that accordingly no measures aiming at raising them were contemplated, contrary to the desire of the association of beet-growers and beet-sugar manufacturers; and, in the middle of April, a letter from the Secretary of Agriculture substantially repeating this declaration.

In July and August sugar prices remained low but at levels slightly above those of June. This slight improvement was probably due partly to a statement issued in June by the Secretary of Agriculture announcing a reduction in the marketable quotas of domestic sugar and partly to another communication at the end of August from the same source indicating that unsold quotas of beet-sugar would not be re-allotted.

The upward movement continued in September. The political situation in Europe undoubtedly contributed to this rise but only to a limited extent; in fact, during October, when the European situation was becoming more settled prices remained at practically the same levels. From November to the end of the year the decline was resumed owing to the restricted volume of business, aggravated by the increase in the quantities of sugar admitted for consumption in 1939 which were much larger than the expectations in the quarters interested.

The London sugar market, like that of New York was rather weak in the first half of 1938 with a downward tendency due to the poor demand for sugar, consumption of which was smaller than it was in the previous year. The market was stagnant also in March and showed no reaction even to the troubled Euro-

Their decisions appeared to be sufficiently cautious and were quickly followed by a rise in the London quotations. There was a slight reaction in August, a normal occurrence after unexpected increases in quotas. In September prices moved upwards under the influence of European events.

During October sugar prices weakened as a result of the international *détente* but early in November the quotations again went up and remained at the new levels until the close of the year as a result of the first estimates of the European beet-sugar production which appeared to be slightly smaller than the 1937-1938 output.

The year 1938 opened on the Surabaya market with rather high quotations following the recovery in business which occurred at the end of 1937. Levels continued high during the whole of January but declined in sympathy with world prices until the beginning of April. Thereafter they remained stationary until the end of the year.

The Java quotations, of course, do not accurately reflect the actual situation, since prices are fixed for each occasion by the Nivas and are not published. Hence the official quotations are nominal and do not reflect the market situation. Sales in the five months January to May were rather limited and below those of the corresponding period of the previous year but the quotations were rather high. In June, July and the first half of August sales were considerable yet the published quotations were lower than in the earlier months. From the middle of August to the end of the year the quantities sold were very limited with, however, a considerable recovery at the end of December but the official quotations remained at the levels of the earlier period.

Prices at Prague from the beginning of the year up to September corresponded fairly closely with those at London and, to a smaller degree, those at New York. Thus, there was a decline up to mid-April, owing to the accumulations on the world market, and a recovery at the end of April on the announcement of the British Government's storage policy. This recovery was confirmed by moderate activity in the following months, particularly after the export quota decisions of the International Sugar Council. During the first three weeks of September quotations rose more owing to the impact of political events than to genuine market movements until the closing of the market, which lasted a month.

At the end of October, on the reopening of the exchange, prices were rather low but gradually rose, accompanied by a new optimism which was a natural reaction after the preceding period of tension.

The Paris market began with fair activity but later business contracted, and prices, like those on the world market, declined almost continuously up to the end of April. Prices then rose slowly owing to a recovery in business and to the unfavourable course of the beet season in France. There was finally a marked rise in September caused by the European complications. In October, after the Munich meeting, prices fell owing to the natural reaction and owing to the drop in purchases necessary for the disposal of the supplies acquired in September. In November there was a further recovery in business, accompanied by a gradual increase in quotations, which continued throughout

December. This movement was attributable to the delay in factory activity, to the meagre yields of the current year and to the suspension of transport on frozen rivers.

Sugar prices on the Magdeburg market varied from a minimum of RM. 31.35 to a maximum of RM. 31.50. Market movements (production, deliveries

and prices) are entirely controlled by the *Hauptvereinigung der deutschen Zuckerwirtschaft* and, being therefore almost entirely shut off from external influences, do not lend themselves even to the briefest analysis.

\* \* \*

The estimates of beet-sugar production (see table on preceding page), now that manufacture is nearly finished in all countries, are much lower in many countries than last season's figures. On the basis of these new estimates and principally of those made by the International Association for Sugar Statistics, some of the figures published have been revised.

The figures for this season in Germany and Czecho-Slovakia refer to their present territories.

The estimate for the U. S. S. R. also has been revised in view of the latest reports on the difficulties encountered in harvesting and transporting the beet to the factories, but this new figure must, like the previous one, be considered as only approximate.

With the new alterations, the aggregate European production of beet-sugar this season is put at 7 per cent. less than last season, while world production is estimated at 3 per cent. less.

E. R.

### Current information on sugar.

*France:* Lifting and transport of beets were completed early in December. Most of the factories finished manufacture by December 20. The remaining silos which were insufficiently protected suffered much damage from the severe cold.

*Argentina:* In December the condition of sugar-beet was good, particularly on irrigated land.

Sugar cane improved in Tucuman in December as a result of the rainfall of the end of November. Hail did some rather serious damage in parts of this province. Crop condition was generally good in other areas except in the National Territory of Formosa where it was average.

*Barbados:* It was reported in November that heavy rains had fallen throughout the island and some damage had been done to the coming sugar crop, but a very large crop was expected. The planting of the 1940 sugar crop however was hindered.

*United States:* The sugar-beet crop, estimated in the December Crop Report at 225,840,000 centals (11,292,000 short tons), is the largest ever obtained in the United States.

The average yield of beet in 1938 was 242 centals (12.1 short tons) per harvested acre compared with 232 centals (11.6 short tons) in 1937 and with a ten-year (1927-1936) average of 220 centals (11.1 short tons).

Some factories began operations about ten days to two weeks in advance of the usual date but the harvest in California began late in July. By the end of the first week in October practically all factories were slicing.

According to the December Crop Report, it was estimated that the 1938 area to be cut for sugar in Louisiana and Florida was 294,000 acres. This is 7.7 per cent. larger than the 273,000 acres cut in 1937 and 26.2 per cent. above the average area cut for sugar in the five preceding years (233,000 acres). Production of cane was forecast at 132,760,000 centals (6,638,000 short tons) compared with 117,840,000 centals (5,892,000 short tons) in 1937 and with an average of 79,084,000 centals (3,954,200 short tons), an increase of 12.7 per cent. and 67.9 per cent. respectively.

*Area and production of sugar-beet.*

1) Including Austria. — 2) Not including crops for seed. — 3) Sugar-beet for factories. — 4) Including beets for distilling. — 5) Figures established from the Plan.

There was some loss and damage occasioned in Louisiana by the several severe freezes in late November and early December. A large acreage of standing cane was windrowed on notice of the first approaching freeze and shortly thereafter additional cane was placed in windrow, thus saving the cane from exposure to further freezing temperatures but, on the other hand, subjecting it to the risk of damage and loss by unseasonably warm weather while waiting to be milled.

The production of raw sugar in the two States was expected to amount to 11,140,000 centals (557,000 short tons) compared with 9,240,000 centals (462,000 short tons from the 1937 crop and with an average for the preceding five years of 6,408,000 centals (320,000 short tons); percentages, 120.6 and 173.8. The crop of 1938 will thus be the largest on record. Faced with a prospective record tonnage, and favoured by the weather, some of the larger factories began their 1938 grinding season earlier than usual.

*Leeward Islands:* It was reported in November that, owing to excellent rains, the sugar canes in Antigua were showing good growth and that the 1939-40 crop planting was in full swing. In St. Kitts the sugar canes had benefited by seasonable weather

and the 1938-39 sugar crop was estimated at 720,000 centals (36,000 short tons) as compared with 626,000 (31,300) in 1937-38 and 642,000 (32,100) on the average of the preceding five seasons; percentages, 114.6 and 111.6.

*Trinidad:* It was reported in November that excessive rains had been experienced, resulting in the retarding of the growth of the sugar canes.

*Netherlands Indies: Java.* — Rainfall was rather uneven in the first half of December but the condition of the cane was satisfactory. The cane is taller than last year.

In the first half of January rainfall was more uneven than in December. In some places there was none, in others it was heavy.

Excessive rains causing flooding occurred only in the Djokja district. The crop was growing in satisfactory conditions except in the north where the cane is rather short (*Aneta*).

*Indochina:* The growth of the cane was normal in October in the various provinces of the Union. Floods did not do serious damage. Cutting was in progress in Tonkin and the west of Cochinchina.

*Egypt:* Maturation of sugar cane is proceeding and cutting of the areas destined for the sugar industry was begun in Asuan Province by the last days of December. The crop is normal.

*Madagascar:* The dry weather of December slightly reduced production from sugar canes. The sugar content, however, increased.

*Mauritius:* It was reported in November that the manufacture of the sugar crop was nearing completion and was likely to constitute a record. The weather during the month was very dry and rain was badly needed.

*Australia:* Young cane growth in the southern sugar plantations of Queensland in November was stimulated by adequate rains, but further north some sections needed more rain. On the Burdekin growth was being assisted by irrigation.

Crushing was drawing to a close with densities improving. A total production of 17,000,000 centals (860,000 short tons) of raw sugar is forecast for Queensland.

### Current information on vines.

*France:* Seasonal work was held up by the severe cold of the last decade of December. It was resumed with the thaw and the gradual rise in temperatures of the first week of January. Pruning is not well advanced in the Nirdi. No damage was done to the vines by the frosts despite their severity. They even accelerated and facilitated clarification of wines.

*Argentina:* Vines in Mendoza were in generally satisfactory condition in December despite the frost and hail damage of earlier months. Prospects fell off in San Juan owing to drought and winds in December. In the Rio Negro valley the grape crop was satisfactory though there was some frost damage. Hail caused rather serious damage in parts of Salta.

*United States:* Except for some rain damage to raisins during early October and to wine and table varieties in late October, the season was relatively favourable for development of the California crops. Production in the eastern States was materially smaller than in 1937 largely because of severe damage from spring frosts. In addition, there was considerable disease damage in New York, Pennsylvania and Ohio.

(a) Vines bearing only. — (b) Vines bearing and not bearing.

(1) The declared area corresponds to declarations of wine production. The undeclared area represents the gap between preliminary figures and complete estimates. The latter only are comparable. The numbers of viticulturists who made crop declarations were: 1,575,000 in 1938, 1,615,000 in 1937, and an average of 1,541,000 in the five years ending 1935. — (2) Average 1935 and 1936. Figures for the three preceding years are not comparable. The comparable figures for 1929, given by the *Catastro agrario*, are 2,313,000 and 7,374,000 acres. — (3) Area of vines and other associated crops. The vines actually occupy  $\frac{1}{3}$  of this area. — (4) European crops almost exclusively for wine.

*Palestine:* The 1938 grape crop is reported to have been fair to poor.

*Algeria:* Manuring and other operations were held up by the November rains. The work was generally fairly well advanced, owing to favourable weather conditions but weeds were spreading considerably at the end of December. Pruning was making good progress in most areas but was slowed down by unfavourable weather and in the Kabylie plain in Constantine it was held up.

## The world olive situation in 1938-39.

The 1938-39 olive season was on the whole unsatisfactory, following the extremely large production of olive-oil in the previous season. The 1937-38 oil production of about 24 million centals (323 million American gallons) was, together with that of the 1927-28 and the 1929-30 seasons, among the highest so far recorded.

In the summer of 1938, throughout the olive-growing area, there was a severe and persistent drought which caused very serious shedding. The autumn rains mitigated, but were too late to repair, the damage. Diseases and pests did fairly serious damage to crops in some countries. In addition to these unfavourable seasonal elements, experience shows that it is a feature of olive production that a large crop is nearly always followed by a small crop, as has happened in the last two years.

\* ) Rough unofficial estimate. — 1) Data not available. — 2) Data calculated on the basis of olive production. — 3) Rounded total.

The various official estimates and reports received by the International Institute of Agriculture enable it to make the following summary of the results of the 1938-39 season in the various countries.

In *Spain* production, according to unofficial estimates, is put at 7 million centals (94 million American gallons), which is lower than last year and the average and barely sufficient for internal requirements. Blossoming was irre-

gular and the lack of rain during the summer months did serious damage in a number of districts. Of the 37 olive-growing provinces in Spain (there are 50 provinces in all, but 13 produce practically no olives); 25 now are under the control of the Nationalist forces while 12 are in the hands of the Republican authorities. Taking the figures of production by Provinces, compared with the average of 1931-32 to 1935-36, which is the last year for which official statistics are available, it is estimated that the 25 Nationalist Provinces produce on the average two-thirds of total production in Spain. Consequently, if the estimate of this season's production is approximately accurate, 4.6 million centals (62 million American gallons) are at the disposition of the Nationalist authorities, not taking into account any stocks from old crops, while 2.3 million centals (31 million American gallons) are in the hands of the Republican authorities.

In *Italy* the persistent drought of July seriously affected olive trees, which had begun the season rather late owing to the cold weather of March, but were on the whole in good condition. Shedding in the first half of August was heavier than usual and considerably reduced crop forecasts. Attacks of *Cycloconium*, *Stictis panizzei*, *Antennaria elaeophila* and tuberculosis were particularly widespread in some districts and insect pests also did some damage. In November the ripening of olives was late in several areas. The quality of the crop however is estimated as good on the whole and the oil yield is expected to be average. The first official estimate gives a total production of olives of 23.1 million centals (1.2 million short tons), which is 38 per cent. less than the very large crop of 1937-38 (the biggest crop of the last decade except for that of 1929-30) and 14 per cent. below the average. Of the most important olivicultural areas the production is much below the average in Apulia (6.6 million centals or 0.3 million short tons in 1938-39 against an average for 1933-34 to 1937-38 of 8.6 million centals or 0.4 million short tons), in Calabria (1.8 or 0.1 million against 4.2 or 0.2) and in Sicily (2.0 or 0.1 million against 3.5 or 0.2). On the other hand, production was above the average in Tuscany (2.4 million centals or 0.1 million short tons against 2.2 or 0.1), and was particularly high in Liguria, where production reached 2.9 or 0.1 against an average of 1.5 or 0.1. The production of table olives is not yet known, but is likely to approximate to 220,000 centals (11,000 short tons). Reducing then this approximate quantity from the total olive production of the present season and assuming an oil yield of 16 per cent., which is the average yield of the last five seasons, the present estimate of oil production in Italy amounts to about 3.7 million centals (50 million American gals.). This figure has been inserted in the table as a provisional estimate until the official figure, which will shortly be issued, has been received.

In *Greece* also, as in Italy, the severe summer drought spoilt the olive season, which began favourably; the spring weather in fact was good for the growth and flowering of olives. In August and up to the middle of September the trees suffered from drought, which caused shedding. The rains of October only partially improved the situation, which was already beyond repair. The damage done by disease and insects does not appear to have been any worse than usual. Oil

production, according to an unofficial estimate, is reported, however, as very low, being less than half the extremely large outturn of 1937-38 and considerably below the average. The production of table olives, which is most important in Central Greece, Euboea and Thessaly, where together on the average about 70 per cent. of the total, is produced, is estimated this year at barely 515,000 centals (26,000 short tons). This figure, is only 26 per cent. of the 1937-38 crop and 82 per cent. of the average. At the end of last October the Greek Government decided to abolish the tax on the production of olive-oil for consumption in order to encourage production and export.

In *Portugal* there was a very poor crop. Official statistics have not yet been published, but production is generally agreed to be very much below the average. The season in fact, was very unfavourable. In the spring and summer, olive trees lost a large proportion of their blossom, particularly as the result of drought, which, with the very high temperatures, later caused shedding of the fruit. Rain in September and October partially improved fruit formation and checked shedding. The crop is very variable from one district to another. In the south and particularly in the Beja district flies did serious damage. Crop condition in the north, where the rainfall is normally very high, was on the whole better than in other parts of the country, particularly at Villa Real and Bragança, but even there it was below normal. In the centre, which contains the most important olivicultural districts (Estremadura and Beira alone possess 60 per cent. of the total number of olive trees in Portugal) the condition of crops in the last few months with very few exceptions has been very bad, particularly at Leiria, Santarém and Coimbra. In the South the season was also unfavourable, particularly in the coastal district of Faro, but was better at Évora and Setúbal.

The season in *France* opened very well with an excellent bloom. But the summer weather was fairly unfavourable and olives suffered considerable losses. On the whole however, results are considered satisfactory and it is estimated that the olive crop is approximately 1,100,000 centals (55,000 short tons) which is above the average. Picking was favoured by the weather and took place in good conditions. Some damage was done in Corsica and on the Mediterranean coast by flies, while in the interior round Vaucluse and Drôme there were attacks of tuberculosis. In Var and Gard, which are the two most important olivicultural *départements* of France, the season was fairly successful. Aggregate oil production, estimated from the production of olives and an average yield, is considered as good and better than last year or the average.

In *Yugoslavia* total production is estimated at 50 per cent. less than the very abundant outturn of last year but is only slightly below the average. In this country also a drought persisted during growth and the season was unfavourable during maturation, so that yields were heavily reduced. In Savska, which is of little importance in olive production, production is very poor. In the Provinces of Primorska and Zetska (olivicultural areas of Biogradska, Šibenicki and Dubrovački) results are expected to vary from average to rather below average.

Among the more important Asiatic countries, *Turkey* obtained a fairly plentiful crop rather larger than that of last year and the average. The course

of the season, except for some local damage caused by vegetal parasites and insects, was good in the important producing areas of Mugla, Aydin and Denizli. It was less favourable in the south (Antalya, Isel) where production was light. Good yields were obtained also in Balikesir which, together with the Bursa district, is one of the most important areas of production of olives for direct consumption.

In *Syria and Lebanon*, the season was favourable up to the end of June and growth was good at that date; flowering also occurred in good conditions. The summer, however, was very dry and caused considerable damage. Oil production is estimated to be slightly above average but much below the very heavy crop of 1937-38.

The year gave very satisfactory results in *Palestine*. Favoured by adequate moisture supplies, fruiting was normal. Oil production is estimated to be good and even larger than the plentiful outturn of last year and the average. In the *Italian Aegean Islands* (Rodi and Coo) the climate was fairly good but the high winds, typical of these islands, did some damage. In *Cyprus* flowering and fruiting was almost normal but there was fly damage.

The French possessions in North Africa obtained light, below average crops on the whole.

In *Algeria*, the year 1938-39 began badly. In July very hot and dry weather caused considerable shedding. Rain brought a slight improvement in November but the lack of rainfall in October and the high temperatures caused further damage. There was a spread of fly infestation, particularly near the coast. In all, the production of olives, including those for direct consumption, large quantities of which are grown in Oran and Alger, is estimated to be less than 1,100,000 centals (55,000 short tons) compared with an average of more than double this quantity. The crop was particularly poor in Kabylie and in the important Tizi-Ouzou area. Quality is considered mediocre.

The situation in *French Morocco* was no better. Poor fruiting followed excellent flowering. Fly caused appreciable damage and the olives were expected to be of poor quality, especially on native lands where nearly all the Moroccan olive groves are situated. In both Fez and Marrakesh, which are the chief areas, the crop is estimated to be light and below average.

In *Tunisia* the crop was barely mediocre owing to winds and lack of moisture. In the north (Tunis and Bizerta) and on the High Plateaux (Kef) ripening was hindered by drought and excessively high temperatures; there was heavy shedding. In the Sahel area (Sousse) tuberculosis was especially severe. In Sfax, a highly important olive area, fruit was small; parasite infestation was comparatively light but, owing to the winds of the end of October, shedding of fruit was heavy, especially on trees affected by drought. Olive results in Tunisia are thus meagre and below the good outturn of last year and the average.

The following indications as available on the two American countries, *Argentina* and the *United States*, where olive growing is of some importance. The crop gathered in Argentina last May gave rather poor results in the Andine regions. The low yields were the result of wind damage and insufficient rain. However

the crop was estimated to be heavier than that of the preceding year because the new plantations are now bearing. There has been an appreciable expansion in plantings in recent years in the Andine region. The condition of olive trees in December varied from average to good. In the United States, the condition of the trees in autumn pointed to a heavy crop. Flowering was good and, on the whole, not affected by adverse factors. The production of California (representing practically the entire production of the country) is this year much above the average. It is now estimated at 800,000 centals (40,000 short tons) against 560,000 centals (28,000 short tons) in 1937-38 and an average of 451,000 centals (22,500 short tons); percentages, 142.9 and 177.5.

On the basis of the information received by the Institute from Governments and from other sources, world production of olive oil in 1938-39 is estimated at 16.1 million centals (214.3 million American gallons) composed of 13.6 (181.8) millions in Europe, 1.4 (18.6) millions in Asia and 1.0 (13.7) millions in Africa. Production was 24.2 (322.7) millions in 1937-38, 18.3 (244.6 millions) in the period 1932-33 to 1936-37 and 19.1 (254.2) millions in the period 1927-28 to 1931-32. The 1938-39 outturn thus shows a decrease of 34 per cent. from that of the previous year, of 12 per cent. from the 1932-33/1936-37 average and of 16 per cent. from the 1927-28/1931-32 average.

M. COSTA.

### Current information on flax.

*Argentina:* The weather conditions of December were generally favourable for threshing and for the growth of late crops, which were in average condition at the beginning of January.

*United States:* The 1938 linseed crop, at 4,576,000 centals (8,171,000 bushels) is 15.3 per cent. larger than the 1937 crop but 6.9 per cent. below the 1932-36 average and considerably smaller than the average of earlier years. The yield per harvested acre of 4.8 centals (8.6 bushels) is the highest since 1927 and was above the 1927-1936 average in all States except Michigan. The 1937 yield was exceeded in all States except North Dakota. Drought and insects lowered yields in the Dakotas from earlier prospects. The loss from frost was negligible and the extended growing season resulted in improved quality.

*Uruguay:* The harvesting of linseed was proceeding in good conditions at the beginning of January. There were some reports of insect damage but, according to the first official estimate, linseed production this year was very plentiful, exceeding the crop of 1937-38 by more than one third and the average of the preceding five years by 82.3 per cent.

*India:* The first estimate of the area under linseed in 1939 is 3,094,000 acres against the corresponding estimate of 2,948,000 acres in 1938 and the corresponding average of 2,572,000 acres in 1933 to 1937; percentages, 105.0 and 120.3.

## Current information on cotton.

*Greece:* The hot and rather dry weather of the first half of November was favourable for the picking of cotton in early plantations. On late plantations the unfavourable weather of the last decade of November hampered cotton picking and even damaged crops to some extent.

*Argentina:* Cotton sowings, favoured by the weather, were effected in good conditions in the Chaco and Formosa in December. In Corrientes, Santiago and the

1) See: *Summary of Government Cotton Reports*. — 2) Third report, relating to conditions up to the beginning of December, in the entire cotton area of India. — 3) Final estimates. — 4) Exports.

National Mission Territory, however, weather was rather unfavourable. Germination took place in excellent conditions, particularly in the Chaco and in the north of Santa Fé. In all parts of the cotton zone a reduction in the cultivated area is expected owing to the low prices on world markets.

*Egypt:* Cotton ginned up to the end of December, in bales of 478 lb. net weight, was as follows:—

Varieties	1938	1937	1936	1935	1934	1933	1932

(\*) Second estimate. — (1) Including Sakellaridis.

*Uganda:* Owing to the early advent of the dry season in the Eastern and Northern Provinces, the later plantings were adversely affected in November, but early plantings promised average yields. Picking had begun in most districts and quality was satisfactory. In the Buganda and Western Provinces and in Bunyoro district of the Northern Province weather conditions were in general favourable and crop prospects were maintained during November. (See the first estimate for Uganda cotton crop, in the General Table).

### Current information on hops.

*United States:* Hop production in 1938 is estimated at 35,261,000 lb. of which 3,140,000 lb. was unpicked owing to market conditions and the *Agricultural Adjustment Administration* marketing agreement quotas. The yield per acre was 1,119 lb. compared with a ten-year average of 1,195 lb. per acre.

The growing season in Washington was for the most part favourable but in Oregon the yields were reduced by intermittent hot and dry weather. Yields in the coastal counties of California were lower than had been anticipated and shrinkage in drying was heavy.

### Current information on tobacco.

*Argentina:* The crop condition of tobacco in December was generally satisfactory except in the province of Catamarca where growth was restricted by drought. Transplanting was effected in good condition.

*United States:* The definitive December estimates of harvested area and production of tobacco in 1938 compared with 1937 are as follows:—

CLASSIFICATION	Area <i>thousand acres</i>		% 1938 —	Production <i>thousand pounds</i>		% 1938 —
	1938	1937	1937	1938	1937	1937
			= 100			= 100
Flue-cured . . . . .	893.0	973.3	91.7	788,060	854,882	92.2
Fire cured . . . . .	125.0	144.4	86.5	99,763	119,791	83.3
Air-cured, light . . . . .	472.1	478.8	98.6	416,913	425,782	97.9
Air-cured, dark . . . . .	45.2	52.9	85.5	37,863	47,400	79.9

1) Production for sale. — 2) Data published by „Reichsnährstand“. — 3) Figure established from the Plan. — 4) Average 1932, 1933, 1934 and 1936. — 5) European and native crops.

*Algeria:* It is confirmed that the tobacco crop is smaller than last year. In December sowing on seed-beds was carried out in nurseries in the Constantine. The rather mild weather at first favoured growth. But later a cold spell checked development and the seedlings had to be protected.

*Nyasaland:* According to the last report, in most Native Trust Lands tobacco had shown good growth, such slight insect attacks as had occurred having been successfully treated. In the Northern Provinces the emigration of many of the growers had resulted in seed-beds being tended by women and children, and numerous cases of unduly thick sowing had occurred. In the Central Province the preparation of the fields had been held up by lack of rains.

*Southern Rhodesia:* According to the November Report on Agricultural Conditions in Southern Rhodesia, planting rains had not become general by the end of November. Some rain fell in the middle of the month and a moderate acreage was accordingly planted out. Transplanting was resumed during the last few days of the month and, although in many cases seedlings were overgrown and had to be discarded, no immediate shortage was reported. Where necessary old seed beds were re-sown.

### Current information on other products.

#### Cacao.

*Grenada:* Heavy rains fell in November and it was feared that the cacao crop would be adversely affected.

*Trinidad:* It was reported in November that the new cacao crop had been affected by the excessive rains.

*Gold Coast and Togoland under British Mandate:* MAIN CROP 1938-39. — It was reported in November that although the rate of marketing showed a considerable increase since the issue of the previous report, it was still below normal for the time of year. Current prices were reputed to have a retarding effect on movement. It was stated that if low prices continued they might tend to affect the quantity of cacao marketed from distant areas. A summary of marketing since the beginning of the season is given below.

	Sept.	Oct.	Nov.
	(million lb.)		
Total stocks and months . . . . .	33	48	110
Increase during month . . . . .	—	15	62
Exports during month . . . . .	—	21	36
Total marketed during month . . . . .	—	36	98
Old crop marketed . . . . .	—	2	—
New crop marketed. . . . .	4	34	98
Total marketed since the beginning of the season —	—	38	136

It was estimated that 67 per cent. of the crop was ripe by the end of November and that 85 per cent. would be ripe by the end of December. The quantity harvested by the end of November was estimated to be 45 per cent., of which 23 ½ marketed up to the end of the month and 21 ½ in farmers' hands. On an estimated crop of 560 million lb. the 23 ½ per cent. marketed is equivalent to 132 million lb., which is not much different from the estimate of 136 million lb. computed from stocks and export figures.

Rainfall (5.98 inches) and number of wet days (14.7 in November) show marked increases, being 1.22 inches and 3.2 wet days respectively above the ten year mean. These conditions have been favourable for growth but unsuitable for harvesting, fermenting and drying. Slate continued to be a predominant defect and under-fermentation was still apparent owing to unfavourable weather conditions. As foreshadowed in previous reports the percentage of germinated beans is above average.

The result of sampling farmers' cacao in 300 villages throughout the cacao areas gave a mean purity of 91.7 per cent. and showed that about 61 per cent. of the lots were grade I, 34 per cent. were grade II and 4 per cent. grade III. A few lots, totalling less than 1 per cent. were found to be sub-grade, proving that there were still a few lots of old crop held by farmers. The original sampling carried out by licensed Graders and Inspectors showed 64 per cent. of grade I, 36 per cent. of grade II and a negligible quantity of grade III.

The check sampling of 43.7 million lb. of cacao at the time of export gave 58 per cent. of grade I, 39 per cent. of grade II and 3 per cent. of grade III.

The sixth meeting of the Cacao Crop Estimates Committee was held in Accra on December 9 1938 and it was decided that no change should at present be made in the estimate, already published, for the 1938-39 main crop.

MOVEMENT. — Movement statistics for November are as follows:

	November 1938	November 1937
	(million pounds)	
Railway off-loadings, Takoradi . . . . .	31.2	14.0
<i>Exports:—</i>		
Takoradi . . . . .	10.5	11.3
Accra . . . . .	18.8	15.7
Other ports . . . . .	4.5	3.6
<i>All ports . . . . .</i>	<i>33.8</i>	<i>30.6</i>
Eastern Frontier . . . . .	1.8	1.7
<i>Total exports . . . . .</i>	<i>35.6</i>	<i>32.3</i>

## Tea.

*India:* In North India weather in November was cold and seasonable; plucking was practically over. To the end of that month there was an increase of 18,513,000 lb. on the outturn to the same date last season.

In South India there were indications that the dry weather had definitely set in and crop prospects were normal for the time of year; outturn was 13.1 per cent. ahead of that to the same date last year.

*Indochina:* In October the growth of tea shrubs was normal in Annam and Tonkin. Crops were small in Tonkin on pruned and unpruned plantations. Harvesting by planters is finished.

*Nyasaland:* It was reported in November that tea crops had been adversely affected by delayed rains and that production would not be up to expectations.

## Coffee.

*Brazil:* The amount of coffee destroyed since 1931 to the end of December 1938 now totals 85,460,000 centals, of which 3,924,000 were destroyed in the first six months (July 1-December 31) of the present commercial season and 284,000 in December. Exportable stocks in Brazilian ports on December 31 1938 amounted to 4,623,000 centals, of which 3,122,000 were in the port of Santos.

*Netherlands Guiana:* The condition of coffee shrubs in November varied from poor to average.

*Dominican Republic:* The weather in November was very favourable for coffee picking. It is confirmed that the 1938-39 crop is large and of good quality.

*Indochina:* The harvesting of beans of the Arabica variety had begun in the first half of October in Tonkin.

*Angola:* Coffee crop prospects in the present season are average.

*Kenya:* As a result of good rains it was anticipated in November that there would be an improvement in the quality of later pickings of the coffee crop, which had suffered from the drought experienced during the middle of 1938.

*Madagascar:* The condition of coffee plantations on December 1 was good.

*Nyasaland:* In November harvesting of coffee was completed. The crop is very small owing to disease.

*Tanganyika:* During November frequent heavy showers fell in most districts. The bulk of the coffee crops in the Arusha Moshi and Bukoba districts were reported to have already been harvested.

## Groundnuts.

*Argentina:* The weather in December was favourable for the last stages of groundnut sowing and for growth.

*United States:* The production of peanuts harvested as nuts in 1938 was 1,424,825,000 lb. which is the largest crop ever obtained. It is 7.9 per cent. larger than the 1,320,675,000 lb. obtained in 1937 and 23.4 per cent. above the 1932-36 average of 1,154,243,000 lb. The acreage harvested in 1938, estimated at 1,887,000 acres was 14.2 per cent. larger than that of 1937 and 12.9 per cent. above the average. Unfavourable weather conditions during the growing season resulted in below average yields in both the Virginia-Carolina and Southwestern areas but in the Southeastern area the yield was the highest on record.

*Netherlands Indies:* Java and Madura. — The Department of Agricultural Statistics of the Central Statistical Office communicates the following details of the groundnut area:—

	1938 acres	1937 acres
Area harvested in November . . . . .	68,700	69,400
Area harvested from January 1 to November 30 .	594,100	536,000
Area of standing crops at the end of November. .	158,600	138,000

*Indochina:* The groundnut harvest was completed in October in Tonkin. Yields varied between 1,500 and 1,700 lb. per acre.

*Nigeria:* In December buying of new crop groundnuts was reported to be proceeding normally and the yield of the crop generally was said to be good.

### Colza and sesame.

*Poland:* On December 15 1938 the crop condition of winter colza was 3.6 as on November 15 last, compared with 3.8 on December 15 1937.

*India:* The first estimate of the area under rape and mustard in 1939 is 2,722,000 acres against the corresponding estimate of 3,049,000 acres in 1938 and the corresponding average of 2,912,000 acres in 1933 to 1937; percentages, 89.3 and 93.5.

According to the final estimate; the area cultivated to sesame this year is 4,015,000 acres against the corresponding estimate of 4,201,000 in 1937-38 and the corresponding average of 4,286,000, in the five years ending 1936-37; percentages, 96.5 and 93.7. The corresponding estimates of production are 8,154,000 centals (407,700 short tons) against 9,744,000 (487,200) and 9,699,000 (485,000); percentages 83.7 and 84.1.

### Current information on fodder crops.

*Belgium:* The condition of meadows and clover is very satisfactory.

*Estonia:* According to the latest estimate, the area of permanent meadows in 1938 is 2,165,000 acres against 2,186,000 in 1937 and an average 2,244,000 acres in 1932 to 1936; percentages, 99.0 and 96.5. The corresponding production is estimated at 21,028,200 centals (1,051,400 short tons) against 19,440,400 (972,000) and 18,353,600 (917,700); percentages 108.2 and 114.6.

The corresponding figures for rotation meadows are as follows:— area: 460,800 acres, 438,200 acres, 439,000 acres, 105.2 per cent. and 105.0. per cent; production: 14,903,000 centals (745,100 short tons), 11,570,000 centals (578,500 short tons), 10,222,200 centals (511,100 short tons), 128.8 per cent. and 145.8 per cent. For fodder roots and tubers:— area 26,100 acres, 24,000 acres, 20,100 acres, 109.0 per cent. and 130.2 per cent.; production 5,291,800 centals (264,600 short tons) 5,430,000 centals (271,500 short tons), 3,825,700 centals (191,300 short tons), 97.5 per cent. and 138.3 per cent.

*France:* Annual fodders, fodder cabbage, turnips, swedes, rape and mustard, which cover large areas this year in the west and southwest suffered especially from the severe cold and frost of the last decade of December.

*Hungary:* On January 11 it was forecast that fodder supplies would on the whole be adequate for winter feeding.

*Ireland:* The area under mangels in 1938 is estimated at 84,700 acres against 86,500 acres in 1937 and an average of 83,000 acres in 1932 to 1936; percentages, 97.9 and 102.2.

The area under turnips in 1938 is estimated at 143,200 acres against 149,000 acres in 1937 and an average of 161,700 acres in 1932 to 1936; percentages, 96.2 and 88.6.

*Italy:* In the first fortnight of December the average rainfall and the rather high temperature stimulated the growth of catch crops, pastures and meadows. But growth was checked in the second half of the month, particularly in North and Central Italy by severe cold and snow.

*Latvia:* There were adequate supplies of ordinary and concentrated feeds of satisfactory quality at the beginning of the year and the feeding outlook is better than last year's.

*Poland:* On December 15 the crop condition of clover was 3.2 and on November 15 last compared with 3.1 on December 15 1937.

*United Kingdom:* Winter keep was drawn on fairly heavily during the cold spell in December. Supplies should however be sufficient providing the winter is not unduly prolonged.

The harvesting of root crops was practically finished.

The production of hay from rotation meadows in Northern Ireland in 1938 is estimated at 7,709,000 centals (385,000 short tons) against 7,982,000 (399,000) in 1937 and an average of 7,645,000 (382,000) in 1932 to 1936; percentages, 96.6 and 100.8.

Corresponding figures for hay from permanent meadows in 1938 are 10,771,000 centals (539,000 short tons) against 10,686,000 (534,000) in 1937 and an average of 10,035,000 (502,000) in 1932 to 1936; percentages, 100.8 and 107.3.

*Argentina:* The drought of December did some damage to pastures.

*United States:* The December figures of the area and production of hay are as follows:

	1938	1937	Average 1932-1936	% 1938 1937 = 100	Average 1932-1936 = 100
<i>Area</i>					
(thousand acres)					
Tame hay . . . . .	56,309	54,620	56,157	103.1	100.3
Wild hay . . . . .	11,774	11,444	11,540	102.9	102.0
<i>Production</i>					
(thousand centals)					
Tame hay . . . . .	1,605,980	1,468,980	1,341,204	109.3	119.7
Wild hay . . . . .	208,880	183,360	173,196	113.9	120.6
(thousands short tons)					
Tame hay . . . . .	80,299	73,449	67,060	109.3	119.7
Wild hay . . . . .	10,444	9,168	8,660	113.9	120.6

Total hay production in 1938 was the largest for ten years and contrasts sharply with that of recent lean years. With a large carryover from 1937 supplies are now very large.

*Algeria:* Mixed vetches and oats for fodder and barley for green feed sprouted in good conditions. Sowing however is late and so far of limited extent, particularly in the case of bersim clover in Costantine. Rain freshened permanent meadows and pastures and grazings, but the cold weather to a great extent checked growth, which by mid-December had almost stopped and was very thin. Grasses made growth in the Saharan region as a result of the rain.

*Egypt:* Growth of bersim clover was good owing to the favourableness of the weather, and the first cutting is general. The second cutting was commenced in some localities. Watering and manuring of some cultivations were effected before the advent of the period of drought. Crop condition is normal.

*Australia:* The weather between the middle of December and the middle of January was extremely hot and dry throughout Australia and the outlook was serious for dairy farmers in all States, except Tasmania.

### Dairy and honey production in Italy.

According to the industrial census of 1937, the following dairy and apicultural products were manufactured by factories in the year of the census:

Products	ooo lb.
Butter . . . . .	85,126
Cheese . . . . .	372,692
Cream . . . . .	23,966
<i>White ricotta cheese:</i>	
fresh . . . . .	7,667
salted . . . . .	1,374
Honey . . . . .	769

### Current information on livestock and derivatives.

*France:* Animals improved in condition in December. Foot-and-mouth disease is declining but many affected animals have not reached a normal condition. Except in parts of Normandy, animals have been brought indoors but the continued mildness made it possible to graze animals longer than usual.

Feed supplies were substantially economized and there is no longer any concern as to winter feeding. Milk production declined in December, especially after the severe cold of the last decade. Temperatures rose gradually in the first decade of January.

*Hungary:* On January 11 the condition of livestock was good on the whole. There were in some districts cases of foot-and-mouth disease and swine fever but only in a mild form.

*Ireland:* Milk production in December was rather below normal owing to the severe weather conditions.

*Latvia:* Milk production is about 15 to 20 per cent. higher than last year.

*Netherlands:* In December feeding conditions for milch cows were good throughout the country. Compared with December last year milk production was 6 to 7 per cent. lower. In Groningen production was 5 per cent. higher, and in Limburg about equal to last year. But in all other provinces production had declined as follows: Friesland, Drente, and North and South Holland 5 to 6 per cent. less; in Overijsel, Gelderland, Utrecht, Zeeland and North Brabant 10 per cent. less.

*United Kingdom:* Milk yields were difficult to maintain during the cold spell in December in spite of hand feeding and the use of concentrates.

*United States:* With feed grains abundant and cheap, there was a general tendency to feed livestock and poultry rather liberally in 1938. The production of livestock products, however, was limited by relatively small numbers of livestock on farms, particularly of hogs and chickens, as the result of liquidation following the droughts of 1934 and 1936. Although final figures are not yet available, the 1938 production of nearly all classes of livestock and livestock products is expected to be greater than in 1937 and the present tendency is towards increased numbers.

The quantity of milk produced on farms in 1938 is estimated to be the largest on record, totalling 4 to 5 per cent. greater than last year and probably 3 per cent. greater than the previous highest of 1933.

Net production of meat animals during 1938 was expected to show an increase of 7 per cent. over 1937 and to be the largest since 1933. The heaviest increase, estimated to be 12 to 15 per cent. on 1937, has been in hog production. Sheep and lamb production will probably be up about 5 per cent. on last year. Net production of cattle and calves was expected to be slightly larger than in 1937 with heavier slaughter weights and increased inventories of the end of the year more than offsetting the smaller number slaughtered.

The production of eggs in 1938 is estimated to have been about 2 per cent. greater than in 1937 and the largest since 1931. The number of chickens raised in 1938 was thought likely to exceed the number raised in 1937 by about 10 per cent. but to fall 2 to 3 per cent. below the 1927-36 average.

*Algeria:* Health of animals was satisfactory at the end of December. Foot-and-mouth disease has disappeared almost completely. The feed situation, however, is hardly satisfactory owing to the bareness of pastures and grazings. In the littoral and sub-littoral areas (Tell) only work animals are in good condition; other animals are in a precarious condition particularly those on low-lying lands which have been flooded. Herds on the high plateaux, which had been severely tested by the drought of earlier months, had to undergo some spells of great cold and grass was insufficient. There was no abnormal mortality. It was possible to move some of the herds to the Southern Territories where grass is plentiful in many places as a result of rain.

*Union of South Africa:* On the South Coast and Southwest of Cape Province good rains fell in November. Grazing was abundant and sheep were in excellent condition. Heavy rains also in the Karroo, Bechuanaland, Griqualand West, the Border districts and Transkei greatly improved grazing and prospects, particularly in drought affected areas, such as in Bechuanaland. But severe cold and frost later in November in the Border districts, the Northeast and the Transkei were unfavourable for shorn sheep and caused some losses in the Northeast.

Good rains also improved grazing in the Orange Free State, Natal and Transvaal, except in the drought-stricken southwestern highveld. Hail caused stock losses in the Orange Free State. Stock generally were in good condition however.

*Australia:* Milk production declined in the second half of December and first half of January owing to severe drought.

#### Current information on sericulture.

*Indochina:* Following the floods of October the supply of mulberry leaves fell away in Annam and many breeders were obliged to suspend rearings. Mulberries in gardens continued to supply the small amounts necessary for rearings required for breeding. In Tonkin the growth of leaves was checked, as is usual at this period.

\* Indicates that the rate was not quoted during part of the period under review. — n. q. = not quoted. — n. = nominal.

(1) Average rates for entire cargoes, except where otherwise stated, relating to contracts made, during periods often extending back several months, to operate during the weeks specified. — (2) Shipments of wheat and maize: Aug.-July. — (3) Rates for parcels by liners. — (4) Until Dec. 1937, rates for parcels by liners. — (5) "Down River" includes the ports of Buenos Aires, La Plata and Montevideo. — (6) "Up River" includes the ports on the Paraná River as far as San Lorenzo. Cargoes from ports beyond San Lorenzo (Colastine, Santa Fé and Paraná) are subject to an extra rate of freight. — (7) These rates refer to contracts made for shipments of wheat in bulk from South Australia (or Victoria) to the United Kingdom/Continent. They have been adjusted by the differences between the minimum rates ruling for shipments from other Australian States. The minimum rates per ton, fixed by the Tramp Shipping Administrative Committee, are: South Australia 32/-, Western Australia 32/-, New South Wales 31/6 (ex silo), 32/- (ex bags). An additional charge for bagged-wheat is fixed at 2/6 per ton in each case.

(1) The gold franc adopted is that of the former Latin Monetary Union. Up to the end of September 1936, prices in gold francs were obtained by converting original prices into Swiss francs, as these could still be regarded as gold francs. Since the devaluation of the Swiss franc (26 September 1936) original prices have been converted into American dollars, and multiplied by 3.061, which is the coefficient existing between the current dollar and the former franc of the Latin Monetary Union. In cases where the difference between the rates of exchange of the national currency considered, and parity with the dollar did not, during a given month, reach  $2\frac{1}{2}\%$ , the monthly average has been converted on the basis of parity. In other cases the average rate of exchange for the month has been utilized. — (2) Before August 1937: "Barusso".

(1) Parities and current rates are both expressed in U. S. cents (the £ sterling is expressed in dollars). The dollar contains 0.88867 grams of fine gold, i. e. 40.94 % less than formerly. — (2) Former parity. — (3) New parity as from 31 March 1935. — (4) 1 Indochinese piastre = 10 francs; the actual rates vary only slightly from this. — (5) Quotations for the Egyptian pound are omitted, its relationship with the £ sterling being fixed (97 1/2 piasres = 1 £ sterling). — (6) New parity as from Oct. 5, 1936. — (7) New parity as from Oct. 10, 1936.

## PRODUCTION

*Poland:* The final estimates of cereal and potato production in 1938 are given below with comparisons:

	1938	1937	Average 1932-36	% 1938	
				1937 = 100	Average = 100
ooo centals					
Wheat . . . . .	47,882	42,465	42,965	112.8	111.4
Rye . . . . .	159,911	124,293	143,869	128.7	111.2
Barley . . . . .	30,233	30,058	31,566	100.6	95.8
Oats . . . . .	58,565	51,652	56,714	113.4	103.3
Potatoes . . . . .	761,881	886,724	699,124	85.9	109.0

ooo bushels					
Wheat . . . . .	79,802	70,774	71,607	112.8	111.4
Rye . . . . .	285,556	221,953	256,909	128.7	111.2
Barley . . . . .	62,986	62,622	65,764	100.6	95.8
Oats . . . . .	183,015	161,411	177,231	113.4	103.3
Potatoes . . . . .	1,269,777	1,477,843	1,165,183	85.9	109.0

The rye crop is the largest of the last ten years but barley production is rather poor and below the average. Production of wheat, oats and potatoes is fair and above the average.

*Portugal:* Temperatures were rather high in December: there was rain after the 15th. Sowing was difficult in the first half of the month owing to lack of rain. In the second half good progress was made.

Recent frosts checked growth of cereals which was too forward. The frost damaged pastures, but damage was slight and there was plaintful growth for animals.

*Argentina* (Cable of January, 28): The first official estimate of the area sown to maize in 1938-39 is 13,300,000 acres compared with 15,319,000 acres, the final estimate for 1937-38, and with an average of 16,500,000 acres in the five preceding years; percentages, 87.1 and 80.5. General lack of rain and high temperatures did some damage to the crop.

*Indochina:* The condition of the rice crops in November in the various parts of the country, excluding Laos, was as follows.

In Annam, harvesting of tenth month rice was almost finished at the end of November. Yields were satisfactory. Twelfth month rice was growing well in central Annam but poorly in the south. *Mas* prepared for the fifth month rice in north Annam were growing well. Sowing and planting out of third month rice continued everywhere; there is a marked increase in area.

In Cambodia, harvesting of early rice is finished; yields were satisfactory. Main season rice reached maturity; yields promise to be excellent. The crop is anticipated to be larger than last year's.

Transplanted rice in Cochinchina was growing normally. Harvesting of Samo and third month rice was completed; yields appear to be larger than those of last year.

In Tonkin, growth of fifth month rice was hampered by drought. Areas were likely to be reduced if drought continued.

*Maize* planting went forward in November in North Annam and Cambodia. Growth was good in central, north and south Annam.

The *coffee* crop in Tonkin was good on the whole.

*Tea* bushes were growing regularly everywhere.

*Sugar-cane* was in satisfactory condition. Yields were satisfactory.

The harvest of *groundnuts* yielded 11.6 to 12.5 centals per acre in Annam. It was average in Cochinchina. New sowings were begun at the end of November in Cambodia.

Vegetation of mulberries was dormant.

*French Morocco:* The rains that came at the end of November after a fairly prolonged drought were beneficial in most areas, but the continuance of the bad weather in December began to make farmers anxious, particularly in the north.

Except in the north, where rain coincided with the beginning of sowing, seeding was fairly well advanced. That of *barley* and *oats* was finished in nearly all districts with acreages rather higher than last year. The sowings of *soft wheat* showed as light increase in Abda and Taya; those of *hard wheat* are normal.

The picking of *table grapes* is not quite finished in eastern Morocco. Everywhere else, growth has been checked sufficiently for cutting to be undertaken and the vintage begun.

Rain hampered the harvesting of fields of late *cotton*, the fibre of which will certainly have deteriorated.

The very sharp drop in temperature in the mountain zone and the plains round the Atlas mountains checked the growth of grasses. Good *pastures* have sprung up in the coastal area. Livestock, however, suffered from cold and humidity.

On the whole, the agricultural situation in December was satisfactory.

No. 2

## VEGETAL PRODUCTION

### World Wheat Production in 1938 and the Present Condition of Winter Wheat Crops.

Since the publication of the January Crop Report, revisions of 1938 production figures have been few. The estimate for Belgium is greatly increased, the revised figure being 2.3 million bushels more than the first estimate, and

#### World Wheat Production (1)

(million bushels).

YEARS	Europe (2)	North America	South America	Asia (2)	Africa	Oceania	Total (2)	U.S.S.R.
Average 1926-1930 . . . . .	1,342	1,315	300	518	117	164	3,756	836
1931 . . . . .	1,437	1,277	263	570	131	197	3,875	753
1932 . . . . .	1,489	1,213	286	503	140	225	3,856	742
1933 . . . . .	1,746	849	345	555	124	186	3,805	1,018
1934 . . . . .	1,549	816	290	554	153	140	3,502	1,117

1937 . . . . .	1,554	1,069	247	617	129	194	3,810	..
1938 (preliminary) . . . . .	1,845	1,293	378	680	136	151	4,483	...

(1) Not including China, Iran and Iraq. — (2) Not including U. S. S. R.

indicates the exceptionally high yield of 46.9 bushels per acre. According to information received at the last moment, the estimate of production in Germany (excluding Austria) has been increased by 6.4 million bushels. The latest figures for Lithuania and Romania are also higher, but only slightly. For Poland on the other hand, the provisional estimate has been heavily reduced, the present figure being 4.6 million bushels lower, but the 1938 crop may even so be considered large, since it exceeds the average of the last ten years by 11 per cent. and is not far short of the largest two crops of 1930 and 1931. The estimate for Algeria has been further raised by 1.2 million bushels. Finally the Argentine Government has raised its wheat crop estimate by 3.7 million bushels.

Accordingly, the total of world production shows an increase of about 11 million bushels on the figure given in last month's Crop Report.

\* \* \*

During December—the last month for which official trade figures are available— world net exports of wheat were smaller than in November, but about the same as those of December, 1937. The total exports of the first five months of the present season are considerably, namely 32 million bushels, higher than in the corresponding period of the 1937-38 season. The rise may be partly offset by lower exports in the next few months, but it is very possible

\* Aggregate net exports of the normal exporting countries (possible net imports into certain of these countries are not deducted from the totals).

1) Forecast October 1938. — 2) Net exports adjusted in accordance with the monthly variations in stocks of Canadian wheat in the United States and stocks of United States wheat in Canada. — 3) Bulgaria, Lithuania, Poland and Yugoslavia. — 4) Iran, Iraq, Turkey, Chile and Uruguay. — 5) Net imports.

that the Institute's estimate made in October for total exports during the season may prove too low. This provisional estimate will be revised next month when the world wheat situation will be, as usual, reviewed in the light of the latest returns.

The rise in world exports on last season is almost exactly proportionate to the increase in exports from Canada which increased from 49 million bushels in August-December 1937 to 82 millions in the same period of 1938.

The imports into European countries were considerably lower in December 1938 than in the preceding months and even lower than in December 1937. For the first five months of the season there was a total increase on last year of 25 million bushels. Three-fourths of the rise was due to larger imports into the British Isles and Germany. Almost all the other countries of the continent had slightly higher imports than in 1937, the only exceptions being Belgium, France and Greece.

*Net Imports of Wheat into Europe (including flour in terms of wheat) \*.*  
(million bushels).

\* Aggregate net imports of normal importing countries, after deduction of exports, if any.

1) Forecast October 1938. — 2) After deduction of net exports of 1 million bushels from Czecho-Slovakia. — 3) After deduction of net exports of 1.1 million bushels from Sweden. — 4) After deduction of net exports of 0.4 million bushels from Sweden and 0.4 million bushels from Czecho-Slovakia. — 5) After deduction of net exports of 9 million bushels from Czecho-Slovakia. — 6) Denmark, Estonia, Finland, Latvia, Norway and Sweden. — 7) Czecho-Slovakia, Spain, Portugal, Albania, Malta, etc.

\* \* \*

The weather in Europe in January and the first half of February appears to have been rather favourable on the whole to the cereal crops. In some areas, particularly in France and parts of the United Kingdom and Ireland,

there was excessive rain. In other regions, especially in southeastern Europe, it was feared that, in the absence of adequate snow-cover, a sudden return of cold conditions might cause damage.

Information received since the publication of the last Crop Report show that the damage caused in France by the frost of the second half of December was more serious than was first supposed. It is estimated that at least 3,500,000 acres of wheat sowings were partially or totally destroyed and that nearly 30 per cent. of the sown area requires resowing. In Belgium also, the winter cereals, wheat in particular, were seriously damaged but the proportion destroyed has not yet been ascertained.

Tunisia . . . . .												

1) Not including Austria. — 2) Sowings at January 1, 1939. — 3) First estimate.

Though the gaps may be partially filled up by new sowings, it seems that the losses caused by frost in France and the reduction brought about in the British Isles by the unfavourable weather conditions at sowing time offset and perhaps slightly exceed the increase in sowings in other European countries.

The figures of sowings now available are reproduced in the accompanying table. They indicate increases on last year in Germany, Bulgaria and Italy ranging from 4 to 5 per cent.

In the U. S. S. R., alternations of freezing and thawing have had unfavourable effects in several regions, particularly in Central Russia and the Lower Volga, owing to the formation of an ice crust, in some places very thick, and the disappearance of the snow cover. Elsewhere, conditions were normal.

In the United States, the weather conditions of the second half of January were rather favourable. In the first half of February they were changeable;

some areas experienced alternations of freezing and thawing while others report an improvement in the crop situation. Prospects continue to be rather mediocre in the southwest but are better elsewhere.

The wheat crops in India benefited from rain; crop expectations are less pessimistic than they were a month ago, partly because the first estimate of sowings shows a slight increase on last year.

In North Africa, crops are satisfactory on the whole.

### Current information from various countries on Wheat, Rye, Barley and Oats.

#### Europe.

*Germany:* The final figures of area under cereals in Germany, excluding Austria, which were published in last month's Crop Report, have been very slightly revised as follows: wheat 5,037,000 acres, rye 10,535,000 acres, barley 4,135,000 acres, oats 6,666,000 acres, spelt 138,000 acres and meslin 1,459,000 acres. No corresponding revisions have been made for Austria and consequently the figures in the tables have not been changed.

*Belgium:* The weather was exceptionally mild up to the middle of December. Subsequently there was very heavy frost with temperatures as low as 0° F. followed by a heavy snowfall. At the end of the month the thaw had begun. Crop condition just before the frost was generally excellent. It is certain that winter cereals, particularly wheat, were extensively damaged. Nevertheless, it was difficult at the end of the month to estimate what percentage of crops had been completely destroyed.

The latest estimate of production of spelt in 1938 is 503,700 centals (1,259,200 bushels) against 475,900 (1,190,000) in 1937 and an average of 551,700 (1,379,000) in 1932 to 1936; percentages, 105.8 and 91.3.

*Bulgaria:* Sowing of winter cereals was favoured by the weather and was effected in good time. Germination was normal.

The area under winter meslin in 1938-39 is estimated at 196,1000 acres against 202,800 acres in 1937-38 and an average of 206,100 acres in 1932-33 to 1936-37; percentages, 96.7 and 95.1.

The area under winter spelt in 1938-39 is estimated at 22,100 acres against 22,200 acres in 1937-38 and an average of 25,800 acres in 1934-35 to 1936-38; percentages, 99.5 and 85.4.

*Estonia:* The land was completely frozen as early as December. In January there were satisfactory falls of snow, and fields had a cover which though thin was sufficient to protect winter cereal crops.

*France:* It is officially estimated that the percentage of wheat destroyed by the frosts of December 19 and 20 was 70 per cent in the north and Paris basin, 10 to 20 per cent. in the west and east, and practically nil in the centre, southeast and southwest. The total acreage requiring to be re-sown is estimated at least 3,500,000 acres, or not less than 28 per cent of the total area sown on January 1. Of this 2,200,000 only had been completely destroyed, but it is estimated that 1,200,000 to 1,500,000 acres of wheat, partially destroyed, also requires re-sowing.

Rye appears to have resisted the severe frosts well but winter oats and barley suffered very severe damage. In exposed positions, particularly in the north, the seedlings were almost totally destroyed. January was on the whole very mild. In the

## NOTES FOR TABLES OF WHEAT, RYE AND MESLIN.

† The years indicated are those of the harvest, single years referring to the Northern Hemisphere, double years to the Southern. — \* Countries not included in the totals. — § In calculating the totals account has been taken of the probable area cultivated in some countries for which estimates of production are available but not those of area. — w) Winter crop. — s) Spring crop. — 1) Including Austria. — 2) Estimated on May 1. — 3) Provisional estimate. — 4) Including spelt. — 5) Area provided for in the Plan. — 6) Average of three years. — 7) Average of four years. — 8) Including Tigris. — 9) Cultivation by Europeans only. — 10) Area sown. — 11) Average of two years.

second half there was heavy and almost continuous rain and snow. The conditions retarded work, so that it was not always easy to proceed with re-sowing of the very large gaps left by the December frosts. The first fortnight of February was cold but dry and fairly sunny, and was more favourable for cultivation and re-sowing, which seems to have proceeded satisfactorily in most areas.

The Ministry of Agriculture stated that on January 31, 1939 8.2 million centals (13.6 million bushels) of the wheat surplus of the 1938 crop had been effectively reabsorbed by denaturation and export. Moreover, it is estimated that 6.6 million centals (11.0 million bushels) are required for the re-sowing operations. Allowing for a slight increase in bread-making as a result of the reduction of the milling tax, surplus stocks should have diminished by 15.9 million centals (26.5 million bushels) by the beginning of February.

*Greece:* The sowing of winter cereals was finished in all parts of the country at the end of January, in spite of unfavourable weather which had retarded work in certain areas.

*Hungary:* In the four weeks January 11 to February 7 the weather was mostly exceptionally mild. Rainfall was below normal over nine-tenths of the country. In

† The years indicated are those of the harvest, single years referring to the Northern Hemisphere, double years to the Southern. — \* Countries not included in the totals. — § In calculating the totals account has been taken of the probable area cultivated in some countries for which estimates of production are available but not those of area. — (1) Winter crop. — (2) Spring crop. — (3) Including Austria. — (4) Area sown. — (5) Barley and meslin. — (6) Area provided for in the Plan. — (7) Average 1934 to 1936. — (8) Average 1932 to 1935. — (9) Including Tigris. — (10) Area harvested. — (11) Cultivation by Europeans only. — (12) Average 1933/34 to 1936/37.

the first of the four weeks the snow melted completed in almost all parts of Hungary, and in the following three weeks the fields were without any cover, even during the frost (16° to 19° F.) of the last few days of this period.

On February 7 the crop condition of winter cereal seeds was good. No damage by frost had been reported. But the wide range between day and night temperatures constituted a permanent danger.

*Ireland:* January was almost continuously wet. Sowing was delayed but standing crops made reasonably good progress.

*Italy:* In the first half of January the crop condition of wheat and other winter cereals remained good. The temperature was generally low and there were heavy snowfalls. In the second half of the month the weather was milder and there was rain over a wide area. In some parts the growth of crops was considered excessive. The situation at the end of the month was good. The sowing of spring wheat was in progress.

*Latvia:* Temperatures in January were about two degrees above normal on the whole. Precipitation was 50 per cent. above the normal and rainfall varied from 1.4 to 2 inches. Conditions were rather favourable in the first half of the month when fields were snow-covered. Later, weather became warmer, rain fell and the snow melted rapidly. There was more snow at the end of the month but the thin cover did not remain long in the west of the country.

*Lithuania:* Weather conditions in January were fairly settled, with temperatures some degrees above freezing point, and favourable for the winter crops.

*Romania:* In the last week of January the weather was mild throughout the country. The snow in this period only escaped the thaw in the mountains. At the end of the month snow began to fall again. Crop condition of winter crops at this time was good. More snow was desired to protect crops and prevent premature growth. On February 10 crop condition was still good although the lack of snow cover caused some preoccupation. Soil moisture was sufficient.

*United Kingdom:* January was stormy and exceptionally wet, with widespread snowstorms in the Midlands and north and west of England and Scotland. The heavy rain caused extensive flooding, especially in the eastern counties and the Thames valley. In parts of Scotland the ground became waterlogged. Wheat on the whole stood the severe spell fairly well. Barley and oats suffered in certain areas and will have to be partly resown.

*U. S. S. R.:* Following cold weather throughout the first fortnight of January a warm, moist wave about the middle of the month brought a considerable rise in temperature in the European Territory. The day temperature rose above freezing point, to 40° F in the northwest, to 36° or 37° F in the centre and to 43° to 46° F in the south. The wave of warm, wet air caused first snow and then rain to fall. In some areas an ice-crust was formed.

The thaw lasted from three to four days in the west and centre and six to eight days in the south. In the east the thaw only lasted one day. The snow melted almost everywhere in the west and in the centre the depth of snow fell from 5-10 inches to 1-3 inches. The snow also completely disappeared in southern Ukraina, Crimea and North Caucasus. In the east the snow cover was more or less unaffected.

At the beginning of the third decade of January there was a sudden drop in temperature, which caused a crust to form over a large part of the territory, particu-

larly in the central zone, some parts of Ukraina and the lower Volga region. The condition of winter seeds deteriorated in the centre as a result of the ice formation.

In Ukraina tests made on January 10 with plants removed from the ground showed that no damage had been suffered.

At the beginning of February there was another considerable thaw. In some parts of the south the ice crust disappeared, but in the west and centre it still remained to a depth of about 1.5 inches but reaching 3 to 5 inches in some districts.

Cereals have wintered well in Ukraina, Crimea and North Caucasus, but the premature thaw has not been favourable. In the central and lower Volga regions conditions have not been so good. The young plants are reported to be rather thin, particularly wheat.

In the Asiatic territory the snow cover was adequate to protect the seeds from the cold.

#### America.

*Argentina:* The new estimate of the 1938-39 wheat crop issued on February 17, shows an increase of 2,205,000 centals (3,674,000 bushels) on the first estimate made in December. The crop is thus the largest ever obtained with the exception of that of 1928-29. Compared with the unusually low crop of 1937-38 and with the five year average, the increase is 73.0 per cent. and 38.6 per cent. respectively. The exceptionally large outturn of the year is mainly due to the unusually favourable conditions of the season and partly to the larger area cultivated. The increase in the latter over last year and the average was 8.6 per cent. and 16.0 per cent. respectively.

*Canada:* According to the most recent estimate, the area cultivated to buckwheat this year was 375,600 acres against 395,500 in 1937 and 390,100 on the average of the five years ending 1936; percentages, 95.0 and 96.3. The corresponding production is estimated at about 3,398,000 centals (7,079,000 bushels) against 3,718,000 (7,745,000) and 4,040,000 (8,417,000); percentages, 91.4 and 84.1.

*United States:* Weather was more favourable for the winter wheat crop in the second half of January especially in the eastern plains and the Lower Missouri Valley. Missouri was snow-covered and conditions improved in Oklahoma and Texas but the crop in much of Oklahoma remained poor. The outlook improved in Kansas except in the west centre. Conditions continued favourable along the Pacific Coast.

During the first days of February there were alternations of freezing and thawing in the southern Ohio Valley but in eastern parts of the winter wheat belt conditions were fair to satisfactory. Conditions improved south of Kansas though they were still poor in parts, especially in the eastern half of Oklahoma and parts of west-central Texas. There was a further improvement in the eastern half of Kansas but little change elsewhere.

During the second week of February conditions in the southern Ohio Valley were less favourable owing to alternations of freezing and thawing; elsewhere in the eastern belt prospects were fair to good. Winter wheat in Oklahoma and southwards improved with some exceptions. Some improvement was noticed in south west Kansas though the west was very dry and liable to soil-blowing. Top soil was dry in Nebraska but conditions were fair. Favourable snowfall was reported in the northwestern plains while conditions on the Pacific Coast were again favourable.

*Uruguay:* According to an official estimate, exportable wheat stocks in 1938-39 amount to about 2,205,000 centals (3,700,000 bushels).

## Asia.

*Cyprus:* Excellent rains fell in December and cereal prospects were good.

*India:* In the Punjab at the end of the first week of February crop condition was unchanged. There had been light rain in January but the first week of February was dry and rain was badly needed.

In the Central Provinces harvesting had begun in some places in the first days of February. Light showers had fallen in the last week of January and there was moderate rain in Jubbulpore and Bilaspore. The cloudy weather during the latter two weeks had affected the crop in Gram Nimar and Balaghat.

## Africa.

*Algeria:* Official estimates of sowings compared with last year are as follows: hard wheat 110 per cent., soft wheat 100 per cent., barley 110 per cent., oats 100 per cent. Hard wheat sowings are thus the largest recorded in Algeria and the total wheat area will also exceed that of former years; the barley area will be a little larger than it has been in the last five years and considerably above the 1937 minimum; the figure will probably be about equal to the 1932-36 average but still well below the 1927-31 average. The total area sown to winter cereals is the largest on record, exceeding the former record of 1937. Present indications show the expansion of the wheat crop compared with barley. This tendency is especially prominent in the case of hard wheat which declined in the years 1931 to 1934 as a result of the expansion in soft wheat. The latter declined in importance in 1938 and shows no change this year.

January was a favourable month with five weather and normal temperatures. Sowings were finished at the end of the month except on high plateaux and on some native lands. Growth was vigorous on the coast and in the sub-littoral region (Tell). On high areas it was checked by cold. On poorly prepared native lands, there was danger of weed infestation. There have been no serious attacks by parasites. On the whole, crops looked well at the end of January.

*Egypt:* Growth of the wheat crop was on the whole satisfactory, notwithstanding lack of rain during January while the winter closure of irrigation canals was still in force. Formation of ears has begun in a few early fields in some localities. Manuring was still practised on areas not manured last month. Watering was finished in localities where artesian water was available. Crops were normal. Growth of the barley crop was progressing satisfactorily. Formation of ears has started in a few early cultivations. Manuring and watering from artesian wells were finished during the month.

*French Morocco:* After a spell of persistent rain in the first three weeks of December, conditions became more favourable in January. The winter sowings, which had been delayed by the rain, were finished everywhere at the end of January. Sprouting was good and growth satisfactory except in east Morocco, where grains sown without irrigation were beginning to show the effects of drought. On the whole, native sowings are about equal to those of last year with an increasing tendency in Sous and the Rabat district.

*Tunisia:* In January rainfall was rather heavy in the north but distinctly below average in the centre and south. Despite rather low temperatures, the cereal sowings looked well at the end of the month in all parts of the country.

## Oceania.

*Australia* (Cable of February 15): The wheat harvest in Western Australia is completed. Slight damage is reported in a small part of the State. In South Australia the harvest is completed. Results are very satisfactory as to quality. In New South Wales during the early part of last month the weather was hot, but during the latter part of the month there was partial rainfall. In Victoria the harvest is completed. The weather was dry in the greater part of the State.

## Current information on Maize.

*Argentina:* According to a report of the Department of Rural Economy and Statistics of the Argentine Ministry of Agriculture, issued on January 19, the condition of the maize crops in the first half of January was below average everywhere. The lack of rain and the very high temperatures of the first four days of the month seriously delayed sowing, especially in the greater part of Córdoba, in central Santa Fé and in parts of Entre-Ríos. Rains in the second half of January mitigated damage in these provinces and in the country as a whole and brought about a material improvement in crop condition.

*Netherlands Guiana:* As a result of excessive rain many maize plants were destroyed and had to be replaced by new sowings. Crop condition was fairly good.

*Netherlands Indies:* Java and Madura. — The Department of Agricultural Statistics of the Central Statistical Office communicates the following details on the maize area:—

	1938 acres	1937 acres
Area harvested in December . . . . .	437,100	432,000
Area harvested from January 1 to December 31	4,956,800	5,112,900
Area of standing crops at the end of December	2,502,700	2,482,000

*Indochina:* At the end of December maize was in flower in North Annam. In Central and South Annam new crop was sown at the end of December and early in January. In the extreme south, harvesting was proceeding. Yields were light owing to drought at sowing time and to floods at earing.

In Cambodia harvesting on red lands was finished at the end of December. On river banks sowing progressed with the fall in the flood. Maize sown at the end of December and early in January was growing well.

In Cochinchina, owing to the slow retreat of the floods the areas available for dry season maize are less extensive than formerly. Growth of December sowings was good. Preparatory work continued in January and sowing progressed with the removal of the rice.

*Kenya:* In December dry and warm weather conditions were experienced in most districts, except in those around Nairobi where abnormal rain and cool weather prevailed

† The years indicated are those of the harvest, single years referring to the Northern Hemisphere, double years to the Southern. — \* Not included in the total. — § In calculating the totals account has been taken of the probable area cultivated in some countries for which estimates of production are available but not those of area. — 1) Including Austria. — 2) Estimation for the old territory. — 3) Area sown. — 4) Maize sown in spring. — 5) Maize sown in summer. — 6) Crop grown alone. — 7) Mixed crop. — 8) Average 1934 to 1936. — 9) Area fixed by the plan. — 10) Average 1932 to 1935. — 11) Maize for all purposes. — 12) Maize harvested as grain. — 13) Including Tigris. — 14) *Nih* maize. — 15) *Sefi* maize. — 16) Cultivation by Europeans. — 17) Maize and sorghum. — 18) Area harvested. — 19) Cultivation by natives.

### Current information on Rice.

*Argentina:* In January the crop condition of rice was good on the whole, except in certain parts of Corrientes, where crops were affected by lack of rain.

*British Guiana:* It was reported in December that reaping of the rice crop was nearly over, but the outturn would be less than the last crop owing to the earlier heavy rains.

*Burma* (Telegram of February 16): The area harvested is now estimated at 12,529,200 acres, a very slight decrease on the maximum of 12,534,300 attained last season but 1.9 per cent. above the average of 12,296,000 for the five years ending 1936-37. The area sown was 12,820,100 acres, 0.3 per cent. below the 12,861,500 of last season but 1.1 per cent. above the five-year average of 12,682,000 acres. The area destroyed was the smallest of recent years, being only 290,900 acres, a decrease of 11.1 per cent. on the 327,200 of last year and one of 24.6 per cent. on the average of 386,000 acres. While there has been, since the previous month's report, a greater increase in the estimate of area destroyed than in that of area sown, crop condition this season has remained much better than last year and production attains the record of 13,388 million pounds of white rice and derivatives, 17.8 per cent. larger than the 11,363 million of 1937-38 and 10.0 per cent. larger than the five-year average of 12,168 million pounds. The surplus available for export is estimated at 7,952 million pounds of white rice and derivatives, 15.8 per cent. greater than the actual export of 6,864 million in 1938 and 6.9 per cent. above the average export of 7,437 million in the five years 1933-37. This season's estimated export surplus has been exceeded in recent years by actual exports only in 1934, when 8,465 million pounds were exported.

*India:* In Bengal in the last three weeks of January and first week of February the threshing of winter padi continued; the weather was dry. In Orissa there was light rain; harvesting of saradhi padi continued. Threshing also continued in Bihar, where there was also light rain.

In Madras, where there was little rain in the month ending February 4 save for moderate rain in the first week and subsequent light showers particularly in the South, sowing was proceeding. Crop condition was fair save in the Circars, where cyclone damage had occurred, the Carnatic and the South.

*Netherlands Indies:* Java and Madura. — The Department of Agricultural Statistics of the Central Statistical Office communicates the following details on the rice area:—

	1938 acres	1937 acres
<i>Area harvested in December:—</i>		
Wet padi . . . . .	166,100	159,900
Dry padi . . . . .	3,700	5,900
<i>Area harvested from January 1 to December 31:—</i>		
Wet padi . . . . .	8,818,800	8,604,100
Dry padi . . . . .	961,500	966,700
<i>Area of standing crops at the end of December:—</i>		
Wet padi . . . . .	2,233,600	2,172,800
Dry padi . . . . .	823,100	858,000

*Indochina:* The situation of the rice crops in December in the various parts of the Union, except Laos, was as follows.

1) Sown area. — 2) Area planned. — 3) Final report. — 4) Area to mature. — 5) First report.

In Annam harvesting of tenth-month rice was finished everywhere in December; yields were satisfactory. Twelfth-month rice looked well and promised a good crop, except in Quang-ngai (South Annam). Preparations for fifth-month rice were going forward actively in North Annam and, at the end of the month planting out was finished on half the area to be planted. Planting out of third-month rice continued in good conditions, thanks to frequent rains, in Central and South Annam.

In Cambodia main season rice was harvested; with few exceptions, yields were larger than last year's.

In Cochinchina main and mid-season rices were growing normally and looked well. Newly planted out rice from flooded fields was vigorous. Harvesting of early rice was general.

In Tonkin, preparatory work for fifth-month rice was progressing. Many fields were planted out and the young plants grew well thanks to the favourable temperatures during the month.

## Current information on Potatoes.

*France:* The damage done by the unusually severe frosts of December 19 and 20 has reduced the commercial or marketable crop. The early crops, however, do not appear to have suffered very severely from the frost. The wet conditions of the second half of January delayed spring plantings. The first half of February was cold and dry and more favourable for work.

*Italy:* Early potatoes were planted in January. Crop condition was good at the end of the month.

*Argentina:* Potatoes were in average to good condition in January.

## Cane-sugar Production in 1938-39.

Unlike beet-sugar production, cane-sugar production is, according to the first estimates, slightly larger in all continents that last season and only a very little less than the exceptionally large crop of 1936-37.

*Production of Cane-sugar.*

1) Approximate data.

## Current information on Sugar.

*Argentina:* In January the crop condition of sugar-beet was still good.

The condition of sugar-cane plantations in January promised a good crop, except to the north of Santa Fé where the crop had been affected by the summer drought.

*Barbados:* It was reported in December that the coming sugar crop was in excellent condition but more sun would be beneficial. It was expected that some factories would begin grinding shortly.

*British Guiana:* In December most of the sugar estates had completed grinding, and good yields had been obtained.

*Netherlands Guiana:* The condition of sugar-cane was generally satisfactory and yields normal.

*Trinidad:* It was reported in December that sugar grinding was expected to commence towards the end of January. Weather conditions during the month continued to be rather adverse.

## Area and Production of Sugar-beet.

1) Including Austria. — 2) Not including crops for seed. — 3) Sugar-beet for factories. — 4) Including beets for distilling. — 5) Figures established from the Plan.

*The Netherlands Indies: Java.* — In the second half of January rainfall was generally heavy except in certain districts such as Kediri, where it was moderate. Flooding occurred in some districts and there was further lodging. Growth of canes was variable, being satisfactory in certain districts such as Pasoeroean, but mediocre in others such as Kediri and Djokja, while in many districts crop condition and the colour of the canes were poor. The yellow spot disease was more widespread.

In the first half of February the rainfall was variable particularly in the east of Java. At the beginning of the month rain was so heavy that some flooding occurred. But towards the middle of the month the weather was sunning. The growth of the cane was on the whole satisfactory. In the Djokja and north coast districts only was the condition of reserve plantations not so good owing to excessive humidity (Aneta).

*Indochina:* The cutting of the cane had begun in December in Annam and Tonkin. Yields varied from average to good.

*Leeward and Windward Islands:* It was reported in December that a good sugar crop was expected in Antigua. In St. Kitts the crop was stated to be in excellent condition, while it was estimated that the St. Lucia sugar crop would be below expectations owing to the abnormal weather recently experienced in the island.

*Egypt:* The sugar-cane crop is approaching maturity. Cutting of the crop for the sugar factories is in full swing, the factories having started work at the beginning of January. Crop condition is normal.

*Mauritius:* It was reported in December that dry weather continued and if rain was not forthcoming shortly the new crop was likely to be seriously affected, particularly in the north of the island.

## World Wine Production in 1938.

The only production estimate received since last month is that of Italy which amounts to 910,697,000 Imperial gallons (1,093,665,000 American gallons). This figure is not strictly comparable with those of the last two years and it points out an anomaly in the figure of vinification in 1938 previously published. In view of this and pending the statistical corrections necessary for estimating exactly the relative importance of wine production in 1938, the general table of wine production has not been given this month. The other two tables have also been held over since no new figures have been received.

A very rough estimate based on present estimates and recent information on the size of crops would put total production of wine in 1938 in the Northern Hemisphere, excluding the U. S. S. R., at 3,950 to 4,050 million Imperial gallons (4,750 to 4,900 million American gallons). This would be 7 to 10 per cent. larger than that of last year and slightly above the five-year (1932-36) average (3,950 million Imperial gallons or 4,750 million American gallons). After allowing for the small stocks remaining in certain countries at the end of the season, supplies are about or more than 200 (250) million gallons in excess of "normal" disappearance, no allowance being made in the latter for special provisions intended to absorb all or part of the surplus.

Countries with surplus supplies include France and Algeria, Romania, Bulgaria, the United States, Tunisia, French Morocco and, probably, Portugal,

Greece and Yugoslavia although Portugal and the United States have limited production of certain types (Port) or of wine as a whole. The situation in Spain is too obscure to be considered in this summary. Italy and Hungary have average or small supplies compared with normal consumption while the importing countries of central Europe—Germany (including Austria), Switzerland and Czechoslovakia—have rather light crops.

Little information is available on production in the Southern Hemisphere. The outturn appears likely to be smaller than last year and, in some cases, below average, as in Argentina, but the large production of 1938 will leave large stocks weighing on the market in several countries, particularly Argentina, Brazil, Chile and Australia.

P. V.

### Current information on Vines.

*France:* The exceptionally severe cold of the last days of December caused damage to buds and even to shoots of one year old of which the wood was not well formed. In some cases, productive shoots must be grafted on old stocks. On the whole, however, damage was not very considerable. January, on the whole, was very mild with heavy and almost continuous rain in the second half which delayed work and sometimes caused floods. The first half of February, however, was cold and dry. Winter pruning was approaching completion in the south in the middle of the month.

*Argentina:* The condition of vineyards in January was good in Mendoza Province and Rio Negro territory. In the latter a larger crop of grapes than last year was expected. Lack of rain and high temperatures in December damaged vineyards in San Juan Province where condition in January was average. In the other producing centres of the country grape crop prospects in January were good. The picking of table grapes was in progress in January in several provinces.

*Algeria:* The weather in January was fine, so that pruning, winter cultivation, application of fertilizers and root-cleaning proceeded well.

*French Morocco:* Pruning and ploughing continued during January.

### Current information on Olives.

*France:* Frosts at the end of December interrupted olive picking caused shedding and lowered the quality. January, which was very mild, was more favourable for the completion of the harvest.

*Italy:* Olive picking continued in the first half of January in Central Italy and Liguria. Frost did some damage. Picking was practically finished at the end of the month.

*Argentina:* In January the olive crop prospects were good in the principal producing centres, particularly La Rioja and Catamarca and Rio Negro Territory.

*Algeria:* At the end of January olive picking was finished in all parts. The crop is poor. In Constantine production is estimated as about half that of last year.

Quality, however, seems good. In olive-groves pruning had begun and preparation of stocks for grafting was in progress.

*French Morocco:* Olive picking was finished at the end of January.. The crop was light.

*World Production of Olive-oil.*

\* Rough unofficial estimate. — a) Data calculated on the basis of olive production.

**Current information on Flax.**

*Italy:* Flax crops in Sicily and Sardinia were making good progress at the end of January.

*Argentina:* The latest estimate of linseed production in 1938-39, cabled on February 17 by the Argentine Government show a decrease of 1,500,000 centals (2,800,000 bushels) on the former estimate of mid-December. The new figure is only 0.7 per cent. above the final figure for last season but is 10.3 per cent. below the previous five-year average. Production in the present season was obtained from a 5.9 per cent. smaller area than in 1937-38 and 9.2 per cent. smaller than the average. Moreover, weather conditions were not very favourable for flax crops, which also suffered severely from insect pests.

*India:* Toward the end of the second decade of January condition of linseed was reported as fairly good.

## Current information on Cotton.

*Argentina:* The cotton crop was generally satisfactory in all parts in January. Flowering was almost general. Condition in the east of the Chaco was good and growth normal. In central and western parts of this territory a lack of moisture delayed growth. Elsewhere crop condition was average in January and rain was needed.

*Antigua:* It was reported in December that the cotton crop was promising, and prospects were about the same as last year's at the same time, that is to say about 2,000 centals of lint (418 bales of 478 lb.).

*United States:*Summary of Government Cotton Reports  
by cotton season.

**General review of the Statistical Situation of Hops in 1938.**

With the official estimates and other information now available, it is possible to make the following summary of the results of the 1938 hop season.

The total cultivated hop area was smaller than that of 1937. Taking the four principal producing countries which together cultivate four-fifths of the world hop area, the United States and Germany report decreases from 1937 of 8.2 per cent. and 7.8 per cent. respectively. There was a slight increase, however, in England and Wales and Czecho-Slovakia. The combined area of the four countries in 1938, now estimated at approximately 101,000 acres, is the lowest of the last five years but it was appreciably larger than the area of the years 1931 to 1933 which were a period of crisis in the hop industry.

The total area of the other hop-growing countries in 1938 appears to have been slightly smaller than it was in the preceding year. The four countries which have issued estimates up to the present all report decreases. The largest decrease was in Belgium with 13.0 per cent., which was followed by Poland with 6.6 per cent., by Yugoslavia with 2.7 per cent. and by France with 1.1 per cent.

\* Estimate. — 1) Former territory. — 2) Including Austria. — 3) Average of three years.

The other countries of this group have not issued estimates of acreage but their total area was probably little different from what it was in the preceding year. Hence, the total area cultivated in 1938 in these countries may be estimated at 25,000 acres. The total world hop area in 1938 would thus reach 126,000 acres. Compared with the areas recorded in 1937, 1936, 1935 and 1934, the decrease was 2.9, 1.8, 6.8, and 2.4 per cent. respectively while, compared with the average of the years 1927 to 1931, the decrease was 18 per cent.

Reports on hop growing in the various countries in 1938 may be summarized as follows:—

In the *United States*, the crop suffered from heat and had to withstand a drought which lasted from the beginning of the summer. Production prospects as indicated in August improved later in Washington but worsened in September in Oregon and California. In Oregon growth was impeded by hot and dry weather. In California, yields on the coast were appreciably lighter than first expected owing to drying. In parts of Oregon and Washington the crop was left impicked. Production in 1938 is estimated to have been 29 million lb., or only 80 per cent. of the 1937 crop (44 million lb.). Moreover, 3,140,000 lb. of this total were not harvested. The yield was 1,119 lb. per acre compared with a ten-year average of 1,195 lb.

In *England and Wales*, the year was very favourable to hops on the whole, the weather of the summer being alternatively wet and sunny. Production was heavy and the unit yield high.

In the former territory of *Czecho-Slovakia* the growth of hops was uneven in July. The crop was attacked by mildew and flies. In September a poor crop was forecast owing to frequent rain and continuous winds. As to quality, forecasts were very satisfactory.

The Statistical Office of *Czecho-Slovakia*, in its *Bulletin Statistique* No. 11-12 (November-December, 1938), published some interesting information on the hop crops after the cession of the Sudeten territory. *Czecho-Slovakia* has lost 63 per cent. of its hop area and 61.6 per cent. of its hop production. The statistics for 1937 have been calculated on this basis. The cultivated area was 28,500 acres and production amounted to 26,819,000 lb. After allowing for the losses caused by the political changes, the area in 1937 becomes 10,550 acres and production 10,287,000 lb. a loss of 17,950 acres and 16,532,000 lb. The 1938 area for the former territory of *Czecho-Slovakia* is 28,700 acres. No official estimate of production is available yet but the outturn may be put roughly at 23,100,000 lb. of which about 9,920,000 was obtained from areas within the present frontiers.

In *Germany*, the year 1938 was exceptionally favourable for hops. *Pero-nospora* was almost negligible. According to official estimates, the area under hops in the Reich (including Austria but excluding the Sudeten territory) was about 22,200 acres. No official estimate of production has yet been issued but the crop is estimated to be larger than that of 1937.

In *France*, the weather in August was decidedly unfavourable. A severe attack of mildew at the end of the month caused a deterioration in the quality, which up to that time had been good. Picking took place in September. The quality of the crop was moderately good, that of early varieties being excellent but that of late varieties not satisfactory.

In *Yugoslavia* the month of July and the first ten days of August were not favourable for the growth of hops, for excessive humidity and cold nights caused premature withering of the blossom and were responsible for a spread of mildew.

*Yield in pounds per acre.*

COUNTRIES	1938	1937	1936	1935	1934	1933	1932	Average 1927-31
United States . . . . .	1,119	1,280	814	1,227	1,194	1,319	1,093	1,263
England and Wales . . . . .	1,557	1,454	1,541	1,522	1,608	1,432	1,274	1,297

Germany (including Austria) . . . . .	...	993	876	751	608	636	550	589

Present official crop estimates are still too incomplete to enable a precise estimate of world hop production in 1938 to be made. An approximate estimate must therefore be made, based, in the case of those countries which have not yet published official estimates, on the probable production, taking into

consideration the area under cultivation and reports on conditions during the growing season.

For Germany an estimate of 23,800,000 lb. has been adopted and for Czecho-Slovakia (former frontiers) 23,100,000 lb.

World production in 1938 totals approximately 132,300,000 lb. The estimate is of course only provisional and is more likely to be reduced than raised.

\* Estimate. — 1) Old territory. — 2) Including Austria. — 3) Average of three years.

From this estimate, production in 1938 seems less satisfactory than in 1937, when the world total showed a considerable increase, being higher than for a number of years. The fall in production between 1937 and 1938 represents 6.1 per cent.

The principal cause of the decline is almost solely the poor crop this year in the United States, where production fell from 44 million lb. in 1937 to 35 million lb. in 1938, a decrease of 20 per cent.

Briefly, world hop production in 1938, in spite of this decrease, may be considered large, being about 15 per cent. above the average of 1932-1936.

In regard to the world trade in hops, in the following two tables we publish the latest trade statistics of the principal exporting and importing countries. For several countries the 1938 figures are not complete.

\* Estimate. — 1) 8 months. — 2) 6 months. — 3) 11 months.

World exports of hops in 1937 were very high (50,500,000 lb.), which is a slightly higher figure than that of 1936 and 20 per cent. above the average of 1932 to 1936 (40,583,000 lb.), but 8 per cent. less than the average of 1927 to 1931 (54,871,000 lb.).

From 30 to 40 per cent. of this total came from Czecho-Slovakia, Germany being next in order with 10 to 13 per cent., then the United States with 11 to 12 per cent., and Poland with 8 to 10 per cent. These five countries contribute more than 85 per cent. of the world exports of hops.

The principal importing countries are, in order of importance, the United States, the United Kingdom, Belgium, Ireland, France and a group of five

\*) Estimation. — 1) Austria, Netherlands, Sweden, Switzerland and Canada. — 2) 11 months.

countries (Austria, Netherlands, Sweden, Switzerland and Canada), which are large beer-consuming countries. The total imports of this group amount to more than two-thirds of the total.

This table of import statistics shows a clear tendency to a reduction of hops imports into France, caused by the steady increase of internal production. A similar decline took place in United Kingdom imports from 1934 to 1936, but in the last two years a marked increase took place as a result of increased internal consumption. Imports into the other importing countries have remained fairly stable.

The large crop of hops in 1937 was responsible for a fall in prices on all the principal markets of the producing countries in the first eight months of 1938. In September, when the first forecasts of a smaller crop were published and when the new crop was marketed prices rose considerably.

The following table shows the monthly movement of prices on the most important markets.

### *Price of Hops.*

r) New crops.

Beer production and consumption in 1938 remained very large and increased still further on the preceding year in the large producing countries.

E. ARNOLD FERIDY

### Current information on Tobacco.

*Greece:* In pursuance of the new law on tobacco crop regulation which replaces that in force last year, the Ministry of Agriculture has issued its first order providing for an increase of about 25,000 acres over last year in the tobacco area. This increase is authorized mainly in districts producing varieties and qualities in increasing demand on foreign markets. The largest increase is authorized in eastern Macedonia, Thrace, Samos and Lesbos.

*Cyprus:* A report for December, 1938 states that preparations are being made to plant a larger area under tobacco in 1939. Seed-beds in all the tobacco-growing areas had been prepared and sown before the end of 1938. The weather in December was wet and fields were able to store sufficient moisture, so that prospects for the new crop are good.

*Indochina:* The transplantation of the young plants of this season was in progress in Annam, Cambodia and Cochinchina in December. The seed-beds had a good appearance and a tendency to increase the area under cultivation is already noticeable.

*Nyasaland:* It was reported in December that planting of tobacco in the Southern Province had been completed.

*Area and Production of Tobacco.*

1) Production for sale. — 2) Data published by the Reichsnährstand. — 3) Area provided for in the Plan. — 4) Average 1932, 1933, 1934 and 1936. — 5) European and native crops.

*Southern Rhodesia:* According to the December report on agricultural conditions in Southern Rhodesia, the majority of growers had planted practically all their intended acreage of flue-cured tobacco by the end of the year. Given favourable conditions, the remainder of the crop should have been planted by the middle of January. The condition of the crop according to the report was, in general, good. The continuous dull weather and excessive rainfall during the latter half of December appeared, however, to have somewhat retarded growth and caused a gradually increasing incidence of disease.

*Northern Rhodesia:* According to a report dated January 10, the tobacco growing season has started well in the Fort Jameson area, with adequate sub-soil moisture. The number of registered growers has increased and a slightly larger crop than last season's is expected

### Current information on Other Products.

#### Cacao.

*Grenada:* It was reported in December that some cacao estates had started picking, but the wet weather had retarded the drying process.

*Netherlands Guiana:* Despite neglect, the condition of the cacao plantations, which, however, are not extensive, was not unfavourable.

*Trinidad:* It was reported in December that prospects for the cacao crop were unfavourable and a small crop was expected.

*Gold Coast and Togoland under British Mandate:* MAIN CROP 1938-39. — The rainfall and number of wet days during December were considerably above average, but the number of hours of sunshine per day was high, and conditions for harvesting and drying were therefore mainly favourable. An increase in the number of germinated beans was reported from up-country, but analysis of 600 samples taken from farmers' stocks throughout the cacao area during December showed that the parity level was high. The average percentages of defects found were as follows: mould 1.5 per cent., germinated 2.4 per cent, slate 3.2 per cent, weevil 0.5 per cent, defective 1.4 per cent. The mean purity of the beans was 91.7 per cent. About 148 million lb. of cacao were graded by Licensed graders and Inspectors, and 81 million lb. check sampled by the Inspectors at the ports prior to export. A summary of the grade percentages is given in the following table:

*Grade per cent. during December 1938.*

Grade	Farmers' Cacao (600 lots)	Original sampling (148 million lb.)	Check sampling at ports (81 million lb.)
I . . . . .	58.0	56.0	57.0
II . . . . .	34.5	43.7	36.4
III . . . . .	6.0	0.3	6.0
Sub-grade . . . . .	1.5	—	0.6
	100.0	100.0	100.0

The average number of beans in the standard 14 cubic inches space bean count for all ports during December was 125.2.

The farms were reported to present a comparatively bare appearance. Except for the few ripe pods ready for harvest, there was little crop to be seen, and flowering for the mid-crop had not yet become general. The tonnage marketed during December was 165.8 million lb. bringing the total for the season to 299.0 million lb. distributed as follows: marketed in September 4.5, in October 31.3, in November 97.4, in December 165.8. This total of 299 million lb., which represents about 53 per cent. of the estimated crop of 560 million lb., is considerably lower than the three-year mean for 1934-35, 1935-36 and 1936-37 which was 70 per cent. The 1937-38 season is excluded from the calculation on account of the abnormal marketing conditions.

The exports for December were about 92 million lb. bringing the total for the three months to 145 million lb., which includes 29 million lb. of old crop carried over on October 1, 1938, and 2 million lb. of old crop marketed after that date. The net export of this season's crop is therefore 114 million lb.

The movement to the ports, stocks at up-country centres and ports, and exports are summarized in the table below:

	Oct.	Nov. (million lb.)	Dec.	Total
Stocks at end of months:				
up-country . . . . .	16	34	69	—
ports . . . . .	34	76	114	—
<i>Total</i> . . . . .	50	110	183	—

Eastern Frontier . . . . .	2.2	0.0
<i>Total exports</i> . . . . .	92.1	26.0

**Tea.**

*Indochina:* The growth of tea-plants was normal in December.

**Coffee.**

*Brazil:* The total amount of coffee destroyed from 1931 through January 1939 amounted to 86,036,000 centals, of which 3,924,000 were eliminated in the first six months of the present commercial season (July 1-December 31 1938) and 410,000 during January. Stocks in Brazilian ports on January 31, 1939 amounted to 4,726,000 centals, of which 3,267,000 was in Santos.

*Netherlands Guiana:* Under the influence of favourable, weather coffee shrubs made satisfactory growth and maturation took place normally.

*Dominican Republic:* According to January reports, weather conditions during December were favourable to the coffee crop. High yields are expected in the crop year 1938-39.

*Kenya:* According to the most recent estimate, the total area cultivated to coffee in 1938-39 is about 89,800 acres against 93,800 in 1937-38 and 101,600 on the average of the four years ending 1935-36; percentages, 95.8 and 88.3. The corresponding production is estimated at about 355,000 centals of clean coffee against 345,000 in 1937-38 and 332,000 on the average 1932-33 to 1936-37; percentages, 102.8 and 106.8. It was reported in December that the main coffee crop had proved somewhat disappointing as regards quality, owing to the very dry conditions which prevailed in September and October last.

*Madagascar:* The dry weather of December was favourable for the blossoming of coffee shrubs, the crop condition of which on January 1 was good.

*Sierra Leone:* December was favourable for coffee picking. Yields were average.

*Tanganyika:* It was reported in December from the coffee districts that picking had already finished and that planters were engaged in preparing for next season's crop which, given favourable conditions over the course of the next month or two, should prove to be a good one.

*New Caledonia:* Except in the south, the coffee plantations were in excellent condition in December. Prospects for the Robusta variety are very good.

*New Hebrides:* A plentiful crop is expected this year.

**Groundnuts.**

*Argentina:* The weather of December was not favourable for groundnuts. Crop prospects in January were poor to average.

*Netherlands Indies: Java and Madura.* — The Department of Agricultural Statistics of the Central Statistical Office communicates the following details of the groundnut area:—

	1938 acres	1937 acres
Area harvested in December . . . . .	52,600	44,000
Area harvested from January 1 to December 31. . . . .	646,700	580,200
Area of standing crops at the end of December. . . . .	159,100	166,600

*Indochina:* The growth of groundnuts in Annam in December was good. The new sowing was carried out in Cambodia.

## Colza and Sesame.

*Bulgaria:* The area under colza in 1938-39 is estimated at 51,100 acres against 50,900 acres in 1937-38 and an average of 22,000 acres in 1932-33 to 1936-37; percentages, 100.4 and 231.9.

*Hungary:* On February 7 it was reported that winter colza had suffered somewhat from frost.

*India:* Toward the end of the second decade of January the condition of the colza, rapeseed and mustard crops was reported to be fair.

Condition of sesame was reported to be on the whole fair toward the end of the second decade of January.

## Current information on Fodder Crops.

*Germany (former frontiers):* The production of certain fodder crops in 1938 and preceding years was as follows:

	1938	1937	Average 1932-36	1938	1937	Average 1932-36	% 1938 = 100 = 100	
	ooo centals			ooo short tons				
Mangels . . . . .	847,460	893,707	756,387	42,372	44,685	37,819	94.8	112.0
Turnips and swedes	162,962	210,827	193,912	8,148	10,541	9,695	77.3	84.0
Fodder carrots . .	9,619	9,824	9,741	481	491	487	97.9	98.7

*Estonia:* In January feeding conditions were satisfactory. Ample supplies of fodder were available owing to last year's abundant cereal harvest.

*France:* At the end of January, meadows and pastures were in satisfactory condition, despite delay caused by the bad weather of the second half of January in seasonal work and manuring. The first half of February was more favourable in this respect and work went forward satisfactorily. Annual fodders, particularly cabbage, were severely tried by the cold. Mangels in silos or stores were severely affected by frosts on December 19 and 20. Excessive moisture in January made lifting of Jerusalem artichokes difficult and there was a risk of rotting occurring in tubers in the ground but the later cold and dry weather changed the situation in this respect. As a result of the decrease in supplies of fodder tubers, of the damage suffered by winter annual fodders and of the delay in growth of grass, some farmers may have a difficult feed problem, especially at the beginning of the green feed period.

*Hungary:* On February 7 it was anticipated that feed supplies would suffice for the winter.

*Ireland:* January was almost continuously wet. Feed supplies were adequate for normal requirements.

*Italy:* In the first half of January frost did some slight damage to fodder crops in the most exposed areas. In Southern and Insular Italy growth was fairly good. In the second half condition greatly improved as a result of rain.

Final estimates of the fodder area and production of 1938, compared with those of 1937 and 1936 are shown below:—

*Area (000 acres).*

	1938	1937	1936
Rotation meadows (two years old and over) . .	5,123	— 5,043	4,945
Rotation meadows (1st year) . . . . .	2,018	2,055	1,962
Annual fodder crops:			
grown alone . . . . .	736	726	707
catch crops . . . . .	1,374	1,231	1,215
Permanent meadows:			
irrigated . . . . .	744	744	749
unirrigated . . . . .	1,783	1,799	1,813
Permanent meadows-pastures . . . . .	847	848	843
Permanent pastures . . . . .	10,739	10,766	10,779

*Production in thousand centals (expressed in ordinary hay).*

Rotation meadows (two years old and over) . .	250,782	296,933	275,020
Rotation meadows (1st year) . . . . .	29,995	36,658	29,989
Annual fodder crops:			
grown alone . . . . .	21,726	24,461	22,398
catch crops . . . . .	41,660	39,081	34,695

unirrigated . . . . .	2,507	3,045	2,809
Permanent meadows-pastures . . . . .	564	660	614
Permanent pastures . . . . .	2,554	2,814	2,942
Other fodder production . . . . .	6,762	6,863	6,347
<i>Total of fodder production . . .</i>	<i>32,025</i>	<i>36,080</i>	<i>33,480</i>

*Latvia:* In January supplies of fodder and concentrated feed for stock were sufficient and of satisfactory quality.

*United Kingdom:* January was stormy and exceptionally wet, with widespread snowstorms in the Midlands and the north and west of England and Scotland. The heavy rain caused extensive flooding, especially in the Eastern counties and the Thames Valley. There were some severe frosts. Pastures were very bare in Scotland as a result of flooding and frost. Winter keep was drawn on fairly heavily but should suffice if the spring is normal.

*Argentina:* The condition of pastures improved in January following rain.

*Canada:* The final estimates of the area and production of the principal fodder crops in 1938 are given below together with the figures for 1937 and the averages of the five years 1932 to 1936.

	<i>Area.</i> (000 acres)			% 1938	
	1938	1937	Average 1932-1936	1937 = 100	Average = 100
Hay and clover. . . . .	8,820	8,693	8,810	101.5	100.0
Alfalfa . . . . .	859	849	737	101.2	116.6
Grain hay . . . . .	949	1,148	1,449	82.7	65.5
Fodder maize . . . . .	460	447	425	102.9	108.3
Turnips, etc. . . . .	189	186	183	102.0	103.7

	<i>Production.</i> (000 centals)			% 1938	
	1938	1937	Average 1932-1936	1937 = 100	Average = 100
Hay and clover . . . . .	275,960	260,600	256,160	105.9	107.7
Alfalfa . . . . .	41,220	42,140	34,670	97.8	118.9
Grain hay . . . . .	33,480	35,360	44,120	94.7	75.9
Fodder maize . . . . .	88,256	78,550	68,007	112.4	129.8
Turnips, etc. . . . .	38,160	36,300	37,248	105.1	102.4

	(000 short tons)				
	1938	1937	Average 1932-1936	1937 = 100	Average = 100
Hay and clover . . . . .	13,798	13,030	12,808	105.9	107.7
Alfalfa . . . . .	2,061	2,107	1,734	97.8	118.9
Grain hay . . . . .	1,674	1,768	2,206	94.7	75.9
Fodder maize . . . . .	4,413	3,927	3,400	112.4	129.8
Turnips, etc. . . . .	1,908	1,815	1,862	105.1	102.4

*Algeria:* In January the growth of annual fodder crops, consisting especially of mixed vetches and oats, was satisfactory, in spite of a slight backwardness of growth due to night frosts. Pastures on the [whole were in good condition, except in the southern tablelands, where first growth is very slow. If the fine weather continues, growth will be stimulated.

*Egypt:* Growth of the clover crop is on the whole satisfactory, notwithstanding lack of rain during the month. Second cutting was general. Third cutting was started in a few regions. In northern districts hay-making was also started.

## LIVESTOCK AND DERIVATIVES

## Livestock in Germany (1937 territory).

In the following table are given data of the last annual census with the data of the four preceding years for comparison.

*Numbers of Livestock in Germany.*

Classification of categories by sex and age	3 December 1938	3 December 1937	3 December 1936	3 December 1935	5 December 1934 1)
<i>Horses 2)</i> . . . . .	3,442,700	3,433,800	3,410,300	3,389,839	3,360,423

**Production and Consumption of Dairy Products in the Netherlands.**

The following data (provisional for 1938) show the average weekly production and consumption of dairy products which are supervised under the 1933 law on assistance to agriculture during the crisis.

	1938	1937	1936	1935
		(thousand pounds)		
<i>Production:</i>				
Butter . . . . .	4,127	4,116	4,052	3,865
Cheese . . . . .	4,004	3,933	3,675	3,497
Condensed Milk . . . . .	6,636	7,134	5,240	4,043
Milk powder . . . . .	1,199	1,177	1,281	814
Casein. . . . .	101	104	42	55
<i>Consumption:</i>				
Butter . . . . .	1,878	1,856	1,812	2,046
Margarine . . . . .	2,597	2,394	2,044	2,026

A compulsory addition of a certain percentage of butter is made to margarine in the Netherlands for the purpose of increasing butter consumption. This admixture is included under butter.

**Winter Census of Livestock in England and Wales.**

The following table shows the numbers of livestock in England and Wales on December 4, 1938 with comparative figures for June 4, 1938 and December 4, 1937.

	Dec. 4, 1938	June 4, 1938 (thousands)	Dec. 4, 1937
<i>Cattle</i> . . . . .	6,849	6,714	6,761
Calves intended for slaughter as calves . . . . .	44	56	48
Bulls and bull calves being reared for service . . . . .	54	47	49
Bulls for service . . . . .	95	88	93
Heifers in calf . . . . .	458	463	438
Cows in calf but not in milk . . . . .	660	375	648
Cows and heifers in milk . . . . .	2,050	2,237	2,040
Other cattle: under 1 year old . . . . .	1,302	1,263	1,278
1 year old and under 2 . . . . .	1,304	1,290	1,272
2 years old and over . . . . .	882	895	895
<i>Sheep</i> . . . . .	13,899	17,913	13,740
Rams and ram lambs for service . . . . .	323	360	253
Ewe lambs intended for breeding . . . . .	1,265	652	1,526
Ewes for breeding . . . . .	8,535	8,533	8,005
Other sheep: under 1 year old . . . . .	3,053	7,036	3,447
1 year old and over . . . . .	723	1,332	509
<i>Pigs</i> . . . . .	3,854	3,564	3,914
Boars for service . . . . .	32	30	32
Sows for breeding . . . . .	447	433	448
Other pigs: under 2 months old . . . . .	842	885	830
2 months old and over . . . . .	2,533	2,216	2,604
<i>Total poultry</i> . . . . .	36,601	52,540	36,163

### Dairy Production in Switzerland.

The Swiss Dairy Commission has just issued the following provisional dairy statistics.

		1938	1937
<i>Milk herds:</i>			
Milch cows (census) . . . . .	Number	912,516	893,004
Goats for milking (estimate) . . . . .	"	149,000	152,000
<i>Milk production:</i>			
Cows 1938: 6,770 lb.; 1937: 6,680 lb. per year) } thousand lb.		6,305,000	6,091,000
Goats (880 lb. per year) . . . . .			
<i>Milk deliveries at central stations (Brugg estimates):</i>			
+ or — compared with the previous year . . . . .		+ 3.6 %	+ 1.6 %

		(thousand lb.)	
For feeding to livestock . . . . .		1,040,000	1,040,000
For consumption in producers' households . . . . .		840,000	840,000
For sale to other consumers . . . . .		1,390,000	1,411,000
Exported . . . . .		400	400
Imported . . . . .		20,000	18,000
For processing (cheese, butter, condensed milk, etc.) . . . . .		3,100,000	2,824,000
<i>Dairy products obtained:</i>			
Cheese of all kinds . . . . .		118,000	117,000
Butter of all kinds . . . . .		66,000	57,000
Condensed milk and powdered whole milk . . . . .		20,000	18,000

Milk deliveries to central stations and cheese factories were 4.2 per cent. higher on the average than in 1937. The larger size of herds and the exceptionally fine autumn more than offset the ravages of foot-and-mouth diseases. The effects of the latter were to be detected in milk deliveries to markets in Switzerland as a whole only at the end of the year. Assuming that production in producers' households was the same as in 1937, total Swiss production in 1938 was 6,305 million lb., or 3.5 per cent. higher than in 1937. The average production per cow was 6,770 lb., against 6,680 in 1937, and per goat 880 lb.

Consumption in towns having fallen still lower, the surplus milk production had to be used for manufacture of cheese, condensed milk and especially butter.

An increase in stocks of cheese and butter was inevitable in the first and again in the second half of 1938, even though foreign butter was displaced by home-produced butter on the internal market (imports fell from 5,623,000 lb. in 1937 to 343,000 lb. in 1938) and Swiss exports of cheese and condensed milk was increased, though only by heavy financial sacrifices. The cost of milk to the producer was reduced by 1 centime per litre as from September 1, 1938.

### Current information on livestock and derivatives.

*France:* At the end of January the foot-and-mouth epidemic was nearly over, in spite of isolated appearances. Stock however in a number of districts were suffering the after-effects of the disease.

*Hungary:* On February 7 the condition of livestock was generally satisfactory.

*Ireland:* Milk yields were below normal owing to wet weather in January.

*Latvia:* In January milk production showed a tendency to increase.

*Netherlands:* Feeding conditions for milck cows were good in all parts in January. Compared with the same month of last year total milk production declined from 1 to 2 per cent. Production hardly differed from normal in Groningen, Overijsel, Gelderland South Holland and Limburg. It increased by 1 per cent. in Friesland. Elsewhere, it fell 3 to 5 per cent.

*United Kingdom:* Milk yields were difficult to maintain in January.

*Canada:* According to January reports on the dairy situation, feed supplies are holding out well in all parts of Canada, although in the Maritime Provinces the low quality and uneven distribution of grains are having an adverse influence on dairying. While heavier grain rations are needed to maintain production, the tendency is to restrict grain purchases on account of low butter fat prices. Much the same situation exists in Ontario and Quebec although more grains, roots and ensilage are available. Ample feeds are available in the Prairie Provinces and water supplies are sufficient. Low cost concentrates and mill feeds helped to offset the effect of reduced yields in British Columbia and farmers are not expected to experience a shortage of roughage until early spring.

Dairy cows are being maintained in fair condition but unsatisfactory results from low quality feeds in the eastern Provinces are beginning to appear. There is no evidence of any change in the numbers of cows being freshened in Eastern Canada but cows came into lactation later than usual in parts of the Prairies and spring freshenings will also be delayed. There is very little change from last year in the dairy herd in the Prairie Provinces.

Milk production in February was expected to exceed the quantity obtained in February 1938.

The production of creamery butter in Canada on 1938 was 266,887,000 lb. compared with 246,387,000 lb. in 1937. Factory cheese production was 121,315,000 lb. compared with 128,447,000 lb. in 1937.

*United States:* There were as many or more cattle on feed on January 1 this year compared with last in all the Corn Belt States, except Michigan, with the largest relative increase in the western States where cattle feeding had been greatly reduced during the drought years. For the whole region the estimated increase in numbers on feed over last year is 7 per cent. This increase follows one of 15 per cent. made a year earlier but the numbers have not yet reached those of the years of large maize production prior to the drought years. The difference is larger in western than in eastern States of the Belt.

The increase in the Corn Belt is partially offset by a drop of 12 per cent. in the numbers on feed in the 11 Western States. There were decreases also in Texas and Oklahoma.

The numbers of sheep and lambs on feed on January 1, 1939 in the principal feeding States was estimated at 5,700,000 head, a decrease of 5 per cent. from the 5,997,000 head on feed on January 1 last year. Numbers were smaller this year in the Corn Belt States, a slight increase in the Western States of this area being more than offset by the decrease in the Eastern States. There was a decrease also in the Western Sheep States.

In view of the smaller number of sheep and lambs on feed this year, total slaughter during the remainder of the marketing season (up to end of April) is likely to be somewhat smaller than a year earlier, when such slaughter approached record proportions. Lamb marketings after May 1 will depend largely on the outturn of the spring lamb crop. Although conditions in early January were favourable for the spring lamb crop in most States, it is not probable that conditions throughout the winter and early spring will remain as generally favourable as they were last year, when the total lamb crop was the largest on record. Conditions in Texas in early January were unfavourable for the early spring lamb crop but, with an improvement in grazing conditions, marketings may be as large as last year.

According to the December pig crop report, the 1938 fall pig crop was estimated to be 27,651,000 head, an increase of 18 per cent. on 1937. The 1938 fall crop was the largest since 1933. This increase reflects increases in both the number of sows farrowed and in the number of pigs saved per litter.

The increase of 18 per cent. in the 1938 fall crop followed an increase of 13 per cent. in the 1938 spring crop. The combined spring and fall crop was estimated to be about 71.1 million head, or 15 per cent. larger than that of 1937. This is the largest yearly pig crop since 1933 but it is about 11 per cent. smaller than the 1929-33 average, because the crop in the West North Central States and in the Western States was still considerably below the pre-drought average.

Breeding intentions reported about December 1 indicated that the number of sows to farrow in the spring of 1939 will be about 20 per cent. larger than the number farrowed in the spring of 1938. If feed crop production this year is average, it is not unlikely that the total crop of 1939 will reach or exceed 80 million head, which is the average of the five years prior to the drought.

*Algeria:* In January stock were in excellent condition in Oran and most of Constantine. In Alger their condition was rather poor, particularly on the tablelands, owing to the unfavourable weather.

*French Morocco:* After a spell of persistent rain during the first three weeks of December, conditions became more favourable in January. Water supplies were sufficient. Animals suffered chiefly from cold and, except on mountains and in the normally cold regions, there was sufficient growth on grazings to provide a minimum bite for native animals. Europeans are supplementing grazing with indoor feeding with straw or green fodder.

(1) Incomplete data: wheat in transit is not included, wheat-flour only if in mills. See next table. Also wheat "in transit to merchant mills and attached elevators", and stocks of wheat, "bought to arrive" at merchant mills, have been omitted, because the greater part of this wheat is already included in the data given of stocks at these mills. — (2) The figures of the partial quarterly census taken by the Bureau of Census, (see next table), have been increased to allow for stocks in all mills.

Wheat and wheat-flour held by commercial mills in the United States <sup>(1)</sup>.

LOCATION	Last day of month

\* Indicates that the rate was not quoted during part of the period under review. — n. q. = not quoted. — n. = nominal.

(1) Average rates for entire cargoes, except where otherwise stated, relating to contracts made, during periods often extending back several months, to operate during the weeks specified. — (2) Shipments of wheat and maize: Aug.-July. — (3) Rates for parcels by liners. — (4) Until Dec. 1937, rates for parcels by liners. — (5) "Down River" includes the ports of Buenos Aires, La Plata and Montevideo. — (6) "Up River" includes the ports on the Paraná River as far as San Lorenzo. Cargoes from ports beyond San Lorenzo (Colastine, Santa Fé and Paraná) are subject to an extra rate of freight. — (7) These rates refer to contracts made for shipments of wheat in bulk from South Australia (or Victoria) to the United Kingdom/Continent. They have been adjusted by the differences between the minimum rates ruling for shipments from other Australian States. The minimum rates per ton, fixed by the Tramp Shipping Administrative Committee, are: South Australia 32/-, Western Australia 31/-, New South Wales 31/6 (ex silo), 32/- (ex bags). An additional charge for bagged-wheat is fixed at 2/6 per ton in each case. — (8) Revised rates: from second half of Oct. 1938: 3/9.

<sup>1)</sup> Provisional data. — <sup>2)</sup> Index numbers calculated by the Bundesamt für Industrie, Gewerbe und Arbeit; base July 1914.

## VARIATIONS IN THE INDEX-NUMBERS OF PRICES

The index-numbers of prices of agricultural and other products of interest to the farmer, as published by the various countries, are given in the preceding pages.

The data are often very heterogeneous and consequently great care has to be taken in drawing conclusions from the supplementary information given in the following comparative summary table.

COUNTRIES	Percentage variations in the index-numbers of prices of			
	agricultural products	all products	agricultural products	all products
	January 1939 in comparison with			
	December 1938		January 1938	
Germany (products sold by farmers) . . . . .	0.0	—	+ 2.0	—
Germany (wholesale prices) . . . . .	0.0	+ 0.2	+ 2.1	+ 0.9
England and Wales (a) . . . . .	1.1	—	+ 4.0	—
England and Wales (b) . . . . .	3.5	— 1.1	+ 4.3	— 9.8
Argentina . . . . .	0.4	—	— 25.6	— 7.7
Australia . . . . .	0.3	—	—	—
Canada . . . . .	+ 0.3	—	—	—
United States: Bureau of Agric. Economics . . . . .	2.1	— 0.0	— 24.9	— 12.5
United States: Bureau of Labor . . . . .	0.6	—	— 7.8	—
Hungary . . . . .	1.2	— 0.1	— 6.1	— 4.9
Netherlands . . . . .	0.0	— 1.1	+ 1.2	— 0.0
Poland . . . . .	0.2	— 0.6	— 4.7	— 6.6
Sweden . . . . .	1.5	— 0.2	— 8.5	— 5.3
Switzerland . . . . .	8.0	— 0.4	+ 1.5	— 6.3
Yugoslavia (vegetable products) . . . . .	2.0	—	— 4.0	— 3.9
Yugoslavia (animal products) . . . . .	2.4	— 0.0	— 3.9	— 3.4
December 1938 in comparison with				
	November 1938		December 1937	
Belgium . . . . .	— 0.6	—	+ 1.4	—
Ireland . . . . .	— 0.8	—	+ 4.3	—
Lithuania . . . . .	+ 2.2	+ 2.0	+ 2.2	+ 2.0

(a) Data uncorrected for seasonal variation. — (b) Data corrected for seasonal variation.

## EXCHANGE RATES

## PRODUCTION

Uruguay (Telegram of February 24): According to the second official estimate, production of wheat, oats and linseed in 1938-39 compared with the final estimates for 1937-38 and the average of the five preceding years, was as follows:—

	1938-39	1937-38	Average 1932-33 to 1936-37	% 1938-39 1937-38 = 100	% 1938-39 Average = 100
(ooo centals).					
Wheat . . . . .	8,832	9,945	6,611	88.8	133.6
Oats . . . . .	1,572	1,065	770	147.6	204.2
Linseed . . . . .	2,467	2,088	1,544	118.2	159.7
(ooo bushels).					
Wheat . . . . .	14,719	16,575	11,019	88.8	133.6
Oats . . . . .	4,912	3,328	2,405	147.6	204.2
Linseed . . . . .	4,405	3,728	2,758	118.2	159.7

## VEGETAL PRODUCTION

### World Wheat Supplies and Requirements.

The Institute has usually published in the Crop Report for March a revised review of the statistical situation of the world wheat market, examining afresh, in the light of more complete and reliable estimates, the forecasts of world wheat supplies and requirements made in the preceding October. This year, in view of the serious situation on the world wheat market, the Institute has produced a special study of the subject with the title "The World Wheat Situation in 1938-39". This study, after describing the causes of the crisis, sets out the essential features of the wheat problem and the conditions for an improvement in the market. Very detailed statistical tables are given showing the history of wheat crops and markets during recent years. A summary of the various features of the present situation is here reproduced from this publication, though this course is a departure from our usual practice.

### The Wheat Area in 1938.

Sown on an area that exceeded all previous records and favoured by seasonal conditions, the wheat crop of 1938 yielded an exceptionally high outturn. The expansion of the world wheat area began during the Great War and was accelerated during the early post-War years. The expansion continued almost continuously for 15 years, from 1923 to 1938. During this period there were decreases in the cultivated area only in 1924, 1929, 1931 and 1934 but these decreases were slight and of short duration. Added together, they were hardly sufficient to offset the average annual increase. The continuity of the increase

in the wheat area is all the more striking because, during the period under review, the wheat market was shaken by one of the most severe crises it has ever experienced. The expansion in area was much more pronounced in the exporting countries, which are far more exposed to the ill-effects of overproduction than in the importing countries which can be more easily protected.

<sup>(1)</sup> The totals of sown areas were obtained by adding the figures of area sown in the four major exporting countries (Canada, United States, Argentina and Australia) to the figures of areas in other producing countries which generally represent harvested areas. For the latter countries, the two series of figures differ only slightly.

<sup>(2)</sup> Excluding the U. S. S. R., China, Iraq and Iran. — <sup>(3)</sup> Average 1923-27 = 100.

The wheat area in 1938 exceeded the 1923-27 average by nearly 24 per cent. in the exporting countries but only by about 10 per cent. in the importing countries. The increase in the latter group was reduced by the appreciable contraction in Spain resulting from the civil war.

The four great exporting countries have contributed most to the total world increase of 49 million acres in 1938 on the 1923-27 average; over 27 million acres, or 57 per cent., more were sown in these four countries, about 16 millions, or 31 per cent. in the other exporting countries and about 6 millions, or 12 per cent., in the importing countries.

The four principal producing countries, after increasing their wheat areas from 113 to 121 million acres between 1923 and 1927, continued to expand them, despite the serious crisis which set in in 1928, in the six following years when their total area varied between 124 and 133 million acres. The sudden contraction which then took place brought the area down to 119 million acres but the contraction lasted for only the two years 1934 and 1935. This decrease was followed by a large increase when the world market showed signs of recovery. The sown area was 129 million acres in 1936, nearly 140 millions in 1937 and 141 millions in 1938. The last two figures exceeded all previous records.

A similar trend was seen in the other exporting countries. It was especially marked in the Danubian countries but was also considerable in India and North Africa.

The expanding tendency in the area cultivated to wheat, though very marked in nearly all exporting countries, was much more moderate in the majority of the importing countries.

In the European importing countries as a whole, this tendency set in only in 1930. Between 1923 and 1929 the wheat area varied around 48 million acres with extremes of 46.2 millions in 1924 and 48.8 millions in 1927. It remained thus distinctly below the average level of pre-War years (50 million acres). In 1930 an appreciable expansion began. From 49.2 million acres in 1930, the area rose to 50.1 millions in 1931, to 51.8 millions in 1932, to 53.3

millions in 1933 and in 1934 and to 53.4 millions in 1935. In the last three years, however, there has been a slight decrease to 52.5 millions in 1936, 49.5 millions in 1937 and 50.2 millions in 1938. The increase in wheat cultivation was not common to all European countries. A notable exception was France where there has been a steady decline in the wheat crop, which in various districts has given way to more remunerative crops. There has been an appreciable decline also in Spain in recent years owing to the civil war. All other countries show a substantial and uninterrupted expansion since 1930. The countries which show the greatest increases between 1930 and 1938 include the United Kingdom and Ireland with an increase of 900,000 acres or 73 per cent. on 1931, Greece (740,000 acres or 53 per cent. on 1930). Germany (640,000 acres or 15 per cent. on 1930). Italy (540,000 acres or 5 per cent. on 1931) and Czecho-Slovakia (250,000 acres or 12 per cent. on 1930).

A tendency to expand wheat cultivation has also occurred in the extra-European group of importing countries. The area has grown continuously in nearly all these countries with the greatest increases in Japan (an increase of 570,000 acres on 1930) and the Union of South Africa (an increase of 820,000 acres on 1930).

### Wheat Yields in 1938.

After many years of poor yields caused mainly by a succession of exceptionally unfavourable seasons in the principal exporting countries, there was a generally favourable season in 1938 which resulted in a world unit yield distinctly larger than recent averages. The provisional estimates now available indicate an average yield of 15.6 bushels per acre (sown), a level which is comparable with the best yields recorded in the last fifteen years (14.9 bushels in 1927, 15.0 bushels in 1923 and 15.2 bushels in 1928). This result is all the more remarkable because it was obtained from the largest area ever cultivated. Yields however, varied substantially from place to place. In the surplus-producing countries as a whole the yield was barely average when compared with the periods 1923 to 1927 and 1928 to 1932 and it only just exceeded the average yield of the years 1933 to 1937 which was abnormally low. In the importing countries, on the other hand, the yield was very high, exceeding the previous record of this group (1933) by 4 per cent.

Though the yield of the exporting countries as whole in 1938 was average, there were wide variations in the different groups. The four great exporting countries obtained on the whole a mediocre yield which, however, was appreciably larger than those of 1933 and the four following years. It was distinctly below the yields obtained in pre-War years and also below the yields of the years 1923 and 1932 excepting only 1925 and 1929. On the other hand, the results obtained in the European exporting group and in the other exporting countries were extremely satisfactory.

In Europe a record of 25.6 bushels to the acre was obtained, a substantial advance on the preceding record of 24.1 bushels obtained in 1933. Nearly all European countries obtained exceptionally high yields. In some countries, the

Year:						
1938 . . . . .	15.6	108.2	13.4	101.1	23.2	125.8

(1) Excluding the U.S.S.R., China, Iraq and Iran. — (2) Calculated from area sown. — (3) Average 1923-27 = 100.

yields exceeded all previous records (Germany, France, Italy, Belgium, Greece, Sweden, Denmark and Norway); in others, they were equal or close to the maxima (the United Kingdom, Czecho-Slovakia, the Baltic countries, the Netherlands and Switzerland). The only exceptions to these excellent results are Portugal, where a large but not unusually heavy production was expected, and Spain, where the ravages of the civil war and a rather unfavourable season brought the yield down below average.

## Wheat Production in 1938.

As a result of the increase in the cultivated area and the good yield which followed a favourable season, world wheat production in 1938 was exceptionally large. The two factors that determine the size of the crop, the area and the unit yield, worked in the same direction in 1938; this was the reverse of what had happened in previous years when a reduction in the unit yield offset an increase in the cultivated area. In 1938 the two factors did not have the same influence, the increase in area being more important than the increase in yield.

WHEAT. — *Index Numbers of World Area, Yield and Production.*

(Average 1923-27 = 100)

	Area	Yield per acre	Production
Average 1909-13 . . . . .	87.4	104.1	89.9
„ 1923-27 . . . . .	100.0	100.0	100.0
„ 1928-32 . . . . .	111.0	100.0	110.9
„ 1933-37 . . . . .	113.7	92.8	104.5
Year 1938 . . . . .	120.2	108.2	128.9

The extension of area was most noticeable in the exporting group where the great expansion in cultivation was the principal cause of the size of the 1938 crop. The unit yield remained stationary at the average of the years prior to 1933.

WHEAT. — *Index Numbers of Area, Yield  
and Production in Exporting Countries.*

(Average 1923-27 = 100)

		Area	Yield per acre	Production
Average	1909-13 . . . . .	82.8	102.2	84.9
"	1923-27 . . . . .	100.0	100.0	100.0
"	1928-32 . . . . .	112.7	97.8	110.0
"	1933-37 . . . . .	114.3	83.1	95.1
Year	1938 . . . . .	123.6	100.0	124.8

The influence of the growth in area on the 1938 harvest is still more evident in the aggregate results of the four major exporting countries.

WHEAT. — *Index Numbers of Area, Yield  
and Production in the four Major Exporting Countries.*

(Average 1923-27 = 100)

		Area	Yield per acre	Production
Average	1909-13 . . . . .	74.3	96.8	71.9
"	1923-27 . . . . .	100.0	100.0	100.0
"	1928-32 . . . . .	113.7	95.7	108.5
"	1933-37 . . . . .	112.2	72.0	81.1
Year	1938 . . . . .	124.2	89.2	111.6

It will be seen that the poor crops obtained in these countries in the five years ending in 1937 were due to the sharp reduction in the yield per acre, a reduction which completely offset the considerable increase in the cultivated area. In 1938, however, a further increase in area largely offset the effects of a mediocre yield and resulted in a crop exceeding the average by nearly 12 per cent.

In the importing countries, on the other hand, the yield per acre was the more important factor, the cultivated area having varied, on the whole, within narrow limits.

WHEAT. — *Index Numbers of Area, Yield  
and Production in Importing Countries.*

(Average 1923-27 = 100)

		Area	Yield per acre	Production
Average	1909-13 . . . . .	101.7	99.2	100.9
"	1923-27 . . . . .	100.0	100.0	100.0
"	1928-32 . . . . .	105.8	106.5	112.9
"	1933-37 . . . . .	111.2	112.1	125.2
Year	1938 . . . . .	109.6	125.8	138.0

Thus, the large wheat production of 1938 was mainly due to a large increase in the cultivated area in the surplus-producing countries and to a high unit yield in the importing countries.

Another important feature of the 1938 wheat crop was its general abundance. The outturn exceeded the previous record in both exporting and importing groups. It was thus considerably different in its geographical contribution from the 1928 crop which was the previous record. In the earlier year only the exporting group obtained a very plentiful production, results in the importing group being good but not exceptional.

(<sup>1</sup>) Excluding the U. S. S. R., China, Iraq and Iran. — (<sup>2</sup>) Average 1923-27 = 100.

The 1938 crop in the group of four major exporting countries was the largest recorded since 1931 but it was rather smaller than that of 1927 and a good deal below that of 1928. In the other exporting countries, the 1938 crop was the largest ever obtained.

In the European importing countries the harvest was good and very close to the 1933 record. The year was marked by all-round abundance. Nearly all countries of the continent obtained excellent crops. Only three countries—the Netherlands, Portugal and Spain—failed to reach the average of the previous five years and the first two fell short of it by a negligible amount. The crop of Spain, owing to the special circumstances of that country and the unfavourable conditions of the season, was poor. In the absence of official statistics for the whole country, the crop is put at 120 million bushels, which is nearly 30 per cent. below the average production of the years prior to the civil war. All the other countries obtained crops exceeding the average by 10 to 20 per cent. or more. The three principal producers of the continent, France, Italy and Germany, harvested particularly satisfactory crops.

As regards extra-European countries, Egypt, Syria, the Union of South Africa and Chosen obtained good crops but results were mediocre in Japan and even more so in Manchukuo.

As regards its geographical distribution, Europe, the two Americas and Asia obtained large outturns, Africa's crop was about average and Australia's alone was mediocre.

(<sup>1</sup>) Average 1923-27 = 100.

It must be remembered that the figures indicated in the various tables take no account of the crops of two important producing countries, the U. S. S. R. and China, which represent about one third of the total world production. There is no official estimate of the 1938 crop for either of these countries. General information indicates that the crop was below average in the Soviet Union and poor in China. Even after allowance is made for this probable reduction, the world crop of 1938 is none the less very plentiful.

### Exportable Supplies and World Wheat Requirements in 1938-39.

The abundance of world wheat production in 1938, aggravated by the fact that the increase was remarkably evenly distributed among the majority of both importing and exporting countries, resulted in a new disequilibrium between world wheat supply and demand during the present 1938-39 season.

The world wheat market, which in 1937-38 had been exceptionally stable, with supplies only just exceeding requirements and with stocks at a more or less normal level, was thus again thrown into disorder. The new crop surplus in the exporting countries was very much increased, while import requirements were extremely low. Consequently, very large quantities will not be absorbed but will go to swell stocks at the end of the season.

Exportable supplies in 1938-39 are much larger than in the previous five-year period, but still appreciably lower than the record average of the period 1928-29 to 1932-33. World import requirements, however, have been steadily declining.

WHEAT. — *World exportable Supplies.*

(<sup>1</sup>) In the four major exporting countries, in the European exporting countries and afloat. — (<sup>2</sup>) Average 1923-24 to 1927-28 = 100.

The exportable supplies of the present season for by far the greater part consist of 1938 crop wheat. The proportion of old to new crop wheat is naturally very low, being very much less than the average of recent years. The proportion is almost identical with that of the 1928-29 season after the record crop of 1928.

(<sup>1</sup>) Including Poland and Lithuania. — (<sup>2</sup>) Exports.

The greater part of the exportable supplies came from the four major exporting countries, although Australia has only a small surplus owing to her comparatively poor crop. Nevertheless, the exportable supplies of all the minor exporting countries together represent a very much higher proportion of the total than usual and are of record size. Since the War, only in two seasons, 1930-31 and 1931-32, have supplies in these countries approached the level forecast for the present season.

During the last commercial year, a slight reduction in exportable supplies was accompanied by a decrease in import requirements. The statistical situation

was marked by a balance between world supplies and requirements. This year, however, there is a great increase in supplies and a very modest increase in import requirements and supply thus appears to be far in excess of demand. During the first six months of the current year (August 1, 1938—January 31, 1939), for which official figures are now available, total net exports of the surplus-producing countries were 303 million bushels, an increase of 38 millions on the corresponding period of last year. Thus the exportable balance in these countries on February 1, 1939, appears very large and more than double the balance held on February 1, 1938.

(1) Supplies afloat excluded. — (2) Partly estimated.

Against these heavy exportable supplies, the probable import requirements are estimated to be very limited, only slightly exceeding the very small average of the last five seasons.

European imports, even taking into account a supplementary demand for the constitution and building up of reserves, are forecast as hardly larger than last year, while those of the extra-European countries are estimated as definitely less than the average but considerably larger than the very limited imports of last season. In Europe the proportion of wheat imported to total supplies for consumption and carry-over continues at a very low level, due to the abundance of home production and to economic and political influences restricting international trade. This proportion, which oscillated around 40 per cent. before the crisis, fell to an average of 35 per cent. in 1928-29 to 1932-33, to 25 per cent. in 1933-34 to 1937-38 and is forecast to remain at this low level in 1938-39.

The revised estimate of the import requirements of the European importing countries, at 430 million bushels, differs only slightly from the 415 millions estimated last October. No substantial changes in the earlier figures were necessary with the exception of France, for which, instead of net exports of 11 millions, we now estimate net imports of 7 millions.

(1) Total net imports. — (2) Obtained by deducting the demand of the European importing countries from the world import demand. — (3) Total net exports of the exporting countries with an allowance for quantities afloat at the beginning and end of each commercial year.

Out of a probable demand of 430 million bushels for the whole year, net imports during the first six months for all importing countries reached 214 million bushels against 194 millions in the same period last year. In the last six months of the year there remain to be imported 216 million bushels against 211 millions in 1937-38.

The estimate of the demand of the extra-European countries has been raised slightly to 140 million bushels, against an October estimate of 125 millions, to allow for the recovery which set in recently on the Far Eastern markets.

(1) Net exports, deducted from the total. — (2) Estimate.

The surplus of exportable stocks which cannot be absorbed this season will be carried over to the 1939-40 season. It is estimated that the addition that will be made to the stocks of the four large exporting countries will be 390 million bushels and to the stocks of the European exporting countries 40 million bushels, so that on August 1, 1939 these surplus stocks (including stocks afloat, but excluding the minimum carry-over) will total 610 million bushels against 175 million on the same date last year; this quantity is about as large as the record carry-over of 1933.

WHEAT. — *Supplies, Requirements and Carry-over.*

	World exportable supplies	World import requirements		Stocks of exporting coun- tries at end of season <sup>1</sup>	
	million bushels	million bushels	% of exportable supplies	million bushels	% of exportable supplies
Average 1923-24 to 1927-28. . . . .	960	780	81.0	180	19.0

» 1933-34 to 1937-38. . . . .	840	540	64.0	300	36.0
Year 1938-39 (forecast) . . . . .	1,180	570	49.0	610	51.0

(1) Stocks of four major exporting countries, European exporting countries (excluding minimum carry-over of about 160 million bushels) and quantities afloat.

The steadily increasing disequilibrium between world wheat supply and demand should be noted. Imports, which on the average absorbed 81 per cent. of exportable supplies in the 1923-24 to 1927-28 period, only took 59 per cent. in 1928-29 to 1932-33, and 64 per cent. in the last five-year period but they are expected to absorb only 49 per cent. in the current season. Exportable supplies in the present season are thus more than twice as large as the average import requirements of the last six years.

The absorption of the heavy surplus from the exceptionally large crop of 1938 will be neither easy nor rapid. Even assuming that competition

and the fall in prices on the world market will have the effect of increasing consumption, particularly in developing alternative uses of wheat, the experience of the period of low prices from 1928-29 to 1933-34 shows that this increase is hardly likely to exceed 140-180 million bushels.

Even if world consumption could reach 3,900 million bushels, which would be 140 million bushels higher than the average of the last two half decades and 20 millions more than the record figures of 1931-32 and 1932-33, the absorption of the 1938-39 surplus would not be complete and there would still be a very heavy carry-over at the end of the season.

WHEAT. — *World Supplies, Consumption and Stocks.*

(1) Excluding the U. S. S. R., China, Iraq and Iran. — (2) Annual production plus Soviet exports, plus stocks at beginning of season, minus exports to China. — (3) At end of season.

World stocks, consisting of forecasts of stocks in exporting countries, and only rough estimates for stocks in the importing countries, are calculated to amount on August 1, 1939 to exactly the same figure (1,180 million bushels) as the record carry-over of 1934.

### The Condition of the Standing Crops.

The weather conditions in Europe in February and the first part of March was generally favourable for the cereal crops and their condition in the middle of the latter month was considered satisfactory in all countries. In France and Belgium, where considerable proportions of the wheat crops were destroyed by the frosts of the second half of December, it was possible to make extensive resowings but it appears certain that the areas of winter wheat for harvest in these two countries will be smaller than those indicated in the table of sown areas.

The winter wheat area in the whole of Europe is probably about equal to what it was last year. Spring work is proceeding under good conditions on the whole.

At mid-march there was a sudden return of winter conditions with severe cold in all parts of Europe but heavy and widespread falls of snow have apparently saved the crops from serious damage in most parts.

The vague indications on the U. S. S. R. seem to indicate that the crops in the south suffered from drought in the autumn and that recent changes in temperature were not a favourable influence.

Weather conditions from mid-February to mid-March in the United States continued favourable east of the Mississippi and on the Pacific Coast. Snow

 — 4) First estimate.

fell in Kansas and brought an improvement in some parts of this State but in west Kansas and most of Oklahoma prospects were still mediocre. The Department of Agriculture's enquiry as to farmers' spring sowing intentions indicates a substantial reduction in the spring wheat area. The decrease is 4 million acres compared with last year, and 3 million acres compared with the 1933-37 average. The percentage decline from last year is practically the same as that returned for winter wheat. The total wheat area sown in the United States is thus approximately 65,700,000 acres against 79,870,000 acres last year and a 1933-37 average of 71,210,000 acres.

The outlook in India points to an almost normal production but certainly below last year's. The winter in Japan was unfavourable for wheat.

Crop news from French North Africa is very good, the cereals having benefited from rains and showing good prospects. The wheat crop of Egypt, which is more extensive than last year's and the average, is progressing regularly.

As regards sowing preparations in the Southern Hemisphere, soil conditions, as a result of heavy and widespread rains, are favourable in most of the principal wheat areas of Argentina and Australia.

G. CAPONE.

## Current information from various countries on Wheat, Rye, Barley and Oats.

### Europe.

*Belgium:* Weather was cold in the early part of February but turned milder in the second half. Most of the winter wheat area had to be resown owing to the exceptionally severe frosts of December. The other winter cereals—rye and spelt—look well. The first oat sowings were effected at the end of February.

According to the most recent estimate, the area cultivated to spelt for harvest in 1939 is 24,200 acres against 24,500 in 1938 and 32,100 on the average of the five years ending 1937; percentages, 99.0 and 75.5. Corresponding figures for meslin are 4,250, 4,460 and 8,034 acres; percentages, 95.3 and 52.9.

*Bulgaria:* The average temperature in February was rather above normal. Cereals have wintered well and crop condition at the beginning of March was very good. Moisture and rather hot weather were very favourable for the sowing of spring cereals.

According to the most recent estimate, the area cultivated to spelt in 1938 was about 26,080 acres against 19,070 in 1937 and 27,580 on the average of the five years ending 1936; percentages, 136.8 and 94.6. The corresponding production is estimated at about 243,700 centals against 195,000 and 240,400; percentages, 125.0 and 101.4.

*Estonia:* In February the day temperature remained above freezing point and there was frost only at night. Precipitation was very light during the month and in some districts there was none at all. Flooding from melting snow did a little damage in low-lying areas, but crop condition on the whole was satisfactory.

*Finland:* In February the temperature was the highest recorded for this month for many years.

*France:* In the first fortnight of February there were five sunny days with night frosts, while in the second fortnight and the first fortnight of March the weather was more variable, with rain and occasional snow. Field work has made fairly normal progress, although rather frequently interrupted since the middle of February by the inclement weather. At the end of February most of the resowing of wheat with mid-season or so-called alternative varieties had been finished. Nevertheless, there remained a certain area to be resown with spring wheat or minor cereals. Frosts at the beginning of February in some cases aggravated the damage done by the frosts of the end of December. At the end of February the condition of crops that had survived the frost and of the newly sown crops was satisfactory. On March 15, however, there was felt in all areas a need for warmer weather. In the south, weather conditions permitted the sowing of spring oats from the end of February.

*Greece:* Rain at the end of February and at the beginning of March was very favourable for the growth of cereals.

*Hungary:* During the three weeks from February 8 to March 1, exceptionally mild weather prevailed. There were, however, frequent night frosts. Precipitation was below average in about two-thirds of the country. The weather was generally favourable for ploughing for spring sowing. In some areas the sowing of spring wheat, rye and barley had actually begun.

Winter cereals were on the whole in good condition. Late-sown winter wheat was, however, thin in some districts. Minor local damage by night frosts was reported.

## NOTES FOR TABLES OF WHEAT, RYE AND MESLIN.

† The years indicated are those of the harvest, single years referring to the Northern Hemisphere, double years to the Southern. — \* Countries not included in the totals. — §) In calculating the totals account has been taken of the probable area cultivated in some countries for which estimates of production are available but not those of area. — w) Winter crop. — s) Spring crop. — r) Estimated on May 1. — z) Provisional estimate. — 3) Including spelt. — 4) Area provided for in the Plan. — 5) Average of three years. — 6) Average of four years. — 7) Including Tigris. — 8) Cultivation by Europeans only. — 9) Area sown. — 10) Average of two years.

*Ireland:* The first ten days of February were fine but the remainder of the month was wet. Cereals have come through the winter fairly well and losses have been slight. Sowing of spring cereals has only just begun owing to the unfavourable weather.

*Italy:* The first half of February was mainly mild and dry. The condition of wheat and the secondary winter cereals was good. Spring wheat was being sown and work on the winter wheat crop, favoured by the weather, was making good progress. The second half of the month was very favourable on the whole to the cereal crops and their good condition was maintained.

In some areas the low night temperatures somewhat impeded growth which had been reported to be rather advanced in parts. Sowing of spring wheat and barley continued.

*Latvia:* The average temperature in February was about 10° F. higher than the normal for the time of year. Rainfall was slightly below average in the west, but in other areas was as much as double. The ground had a snow cover only for a compa-

## Area and Production of Barley.

† The years indicated are those of the harvest, single years referring to the Northern Hemisphere, double years to the Southern. — \* Countries not included in the totals. — § In calculating the totals account has been taken of the probable area cultivated in some countries for which estimates of production are available but not those of area. — w) Winter crop. — s) Spring crop. — r) Area sown. — 2) Barley and meslin. — 3) Area provided for in the Plan. — 4) Average 1934 to 1936. — 5) Average 1932 to 1935. — 6) Including Tigris. — 7) Area harvested. — 8) Cultivation by Europeans only. — 9) Average 1933/34 to 1936/37.

ratively short period during the month. Field work was considerably retarded by the impassable state of roads.

*Lithuania:* The temperature in February remained fairly steady at several degrees below freezing point and for almost the whole of the month the fields were again covered with snow.

*Romania:* Winter cereal crops were growing well at the beginning of March. The lack of moisture was felt in all parts of the country. But at the end of the first decade of March there was general rain which greatly improved the condition of crops. The snow that fell about the middle of March in Moldavia, north Transylvania, Dobruja and the Danube valley is not regarded with any preoccupation by farmers, who were rather anxious about the possibility of drought.

Ploughing and the sowing of spring cereals made good progress throughout the first half of March.

*United Kingdom:* The weather in February was generally mild and dry, particularly in the south and east. Wheat recovered from the check due to the severe weather of December and January and is on the whole a satisfactory plant, except on some low-lying areas where it has lost colour and is patchy. Barley and oats have also recovered to some extent, but in certain areas the plants have been badly damaged by frost and wet, and complete or partial resowing has been extensively resorted to. Rye is healthy and strong.

February was favourable for winter work. Spring sowing is a little retarded, particularly on heavy soils, which are difficult to work.

In parts of Scotland the weather was stormy in February but in the northeast it was fine. Spring sowing was proceeding in some areas but was retarded in the centre and south.

*U. S. S. R.:* According to recently published official returns, the aggregate production of cereals and leguminous crops for grain in 1938 amounted to 2,094,000,000 centals against 2,652,000,000 in 1937 and an average of 1,860,300,000 in 1932-1936; percentages, 79.0 and 112.6.

In the second half of February and the first decade of March, the weather was almost continuously cold. At the beginning of the second half of March, in the European part of the Union, the fields were snow-covered, except in a large part of Ukraina, in Crimea, North Caucasus and the Rostov region.

## America.

*United States:* The Crop Reporting Board has made the following estimates of the intended acreages of the cereal crops in 1939. The figures are based on reports made by farmers on or about March 1 regarding their planting intentions. The acreages actually planted in 1939 may turn out to be larger or smaller than the indicated acreages owing to weather conditions, price changes, labour supply, financial conditions, the agricultural conservation programme and the effect of these estimates themselves upon farmers' actions.

	Intentions 1939	Area planted 1938	Average planted area 1933-37	% 1938 = 100	% 1939 Average = 100
	(thousand acres)				
All spring wheat. . . . .	19,505	23,515	22,507	82.9	86.7
Durum . . . . .	(3,545)	(3,856)	—	91.9	—
Barley . . . . .	13,219	11,334	12,322	116.6	107.3
Oats . . . . .	35,393	36,615	39,074	96.7	90.6

At the end of February, the soil in the Ohio Valley was saturated and, although there were some complaints of heaving, conditions were mostly fair to good. Prospects were favourable east of the Mississippi. Heavy snows in Kansas and some adjoining sections improved prospects for wheat which survived the long, dry spell. South of Kansas, growth was slow and moisture was needed locally. Conditions on the Pacific Coast were good.

The first week of March was satisfactory in the east. There were some complaints of standing water in the southern part of the Ohio Valley; otherwise conditions were satisfactory. Beneficial snows were experienced in the upper Ohio Valley. In Kansas top-soil moisture was satisfactory, except in the west. The crop was making slow progress in Oklahoma and the general condition was poor except in north-central and northeastern sections. In southern Nebraska some growth was reported and crop condition was fair but there was evidence of considerable winter killing. Favourable conditions prevailed in the Rockies and along the Pacific Coast.

#### Asia.

*India:* Conditions at sowing time were not generally favourable. The crop has been affected by inadequate rains but in the third decade of February its prospects appeared to be fairly good on the whole. Rains were urgently needed.

In the Punjab there were light showers in the fortnight ending February 20 and general rain in the subsequent fortnight. Condition of irrigated crops on March 6 was average, that of unirrigated under average. Some damage had been caused in Gurgaon, Hissar, Amritsar, Sialkot and Multan by hail. In the Central Provinces the sky was clear, with light rain, until the middle of February, when cloudy conditions set in, with hail in places; crops were in fair condition and harvesting was proceeding.

*Japan:* Weather conditions in February were unfavourable for winter wheat and barley.

*Palestine:* Weather conditions during February were very favourable generally speaking. Cereal crops have wintered in good condition, and only slight losses from field mice are reported. General condition of crops on March 1 was good. The wheat crop of 1938 was both short of the usual quantity and badly attacked by rust. Barley grain was good.

#### Africa.

*Algeria:* February was generally wet and cold. Rains caused flooding in the second half. Snow fell on heights at the end of the month. Crops came through the winter in good conditions. Tillering was satisfactory and seedlings are thick. Condition was satisfactory at the end of February. Growth was too exuberant in some places and there were cases of lodging. Floods and whiteworms caused local damage.

*Egypt:* The wheat crop, having been watered at the termination of the period of winter closure of canals, which happened to be droughty, made improved growth. Earling is progressing in early and some general areas. Some few areas in Upper Egypt have entered into the milking stage. Manuring is over. Crop condition is normal.

Water being adequate, growth of the barley crop has improved since last month. Earling is progressing in early and in general cultivations. Grains are progressing into the milking stage in many cultivations, particularly in Upper Egypt. Crop condition is normal.

*French Morocco:* Conditions in February were generally favourable for crops and the agricultural situation has good prospects. The winter cereals grew well in all parts. In Sous and Chiadma barley has begun to ear. Spring sowings, particularly those of maize and sorghum, were favoured by good weather.

*Tunisia:* In February the temperature was above normal and there were heavy rains over the greater part of Tunisia. The frequent rain caused rivulets to form on slopes and floods occurred on low-lying ground in certain areas. At the end of February growth was on the whole very satisfactory in all areas. In the south (Sousse district), plants resumed growth vigorously, sprouting was even and, in spite of the lateness of the season, natives are still engaged in resowing. Weeds however are everywhere very numerous.

*Union of South Africa:* Wheat harvesting was finished in January. Yields were generally good in the southwest of Cape Province, but in Orange Free State, though much better than last year's were not as good as was expected.

### Current information on Maize.

*Argentina:* Heavy rains in February in the principal maize producing centres stimulated growth and crop conditions at the beginning of March varied from average to good.

The second estimate, published on March 8 by the Argentine Government, of the areas sown in the 1938-39 season shows a decrease from the former estimate. The new estimate is 14.5 per cent. lower than the final estimate of sown acreage in the 1937-38 season and 20.9 per cent. less than the previous five-year average. The considerable fall in sown acreage this season compared with previous years is due to the unfavourable weather conditions, particularly drought and high temperatures, during the sowing season.

*United States:* The Crop Reporting Board estimates that the prospective maize plantings in 1939 will cover an area of 92,062,000 acres. This estimate is based on reports received from farmers on or about March 1 regarding their planting intentions (see under Cereals). The area planted in 1938 was 93,257,000 acres and the average planted area in the five years 1933 to 1937 was 100,729,000 acres.

*Netherlands Indies:* Java and Madura. — The Department of Agricultural Statistics of the Central Statistical Office communicates the following details on the maize area:—

	1939 acres	1938 acres
Area harvested in January . . . . .	792,500	708,200
Area of standing crops at the end of January . . . . .	1,773,000	1,807,600

*Indochina:* Drought impeded sowing in Cambodia and Cochinchina, and the dry season crop was in unsatisfactory condition at the end of January. In Annam the January harvest was satisfactory. In Tonkin and Annam, the January sowings profited from favourable conditions.

*Egypt:* According to the most recent estimate, the area cultivated to millet in 1938 was 404,400 acres against 332,000 in 1937 and 326,600 on the average of the five years ending 1936; percentages, 121.8 and 123.8. The corresponding production is estimated at about 10,364,000 centals (20,728,000 bushels) against 8,961,000 (17,921,000) and 8,747,000 (17,493,000); percentages, 115.7 and 118.5.

## Area and Production of Maize.

† The years indicated are those of the harvest, single years referring to the Northern Hemisphere, double years to the Southern. — \* Not included in the total. — § In calculating the totals account has been taken of the probable area cultivated in some countries for which estimates of production are available but not those of area. — 1) Including Austria. — 2) Estimation for the old territory. — 3) Area sown. — 4) Maize sown in spring. — 5) Maize sown in summer. — 6) Crop grown alone. — 7) Mixed crop. — 8) Average 1934 to 1936. — 9) Area fixed by the plan. — 10) Average 1932 to 1935. — 11) Maize for all purposes. — 12) Maize harvested as grain. — 13) Including Tigris. — 14) Nili maize. — 15) Sefi maize. — 16) Cultivation by Europeans. — 17) Maize and sorghum. — 18) Area harvested. — 19) Cultivation by natives.

*Kenya:* Normal hot and dry weather conditions were experienced throughout the Colony during January.

*Union of South Africa:* Heavy rains fell over the greater part of Transvaal in January, but not on the western highveld, where drought continued. In some parts maize crops were waterlogged. On the whole, however, crop prospects were bright.

In the Orange Free State the first three weeks of January were very hot, but in the last week good rains fell throughout the province. Crop prospects were good.

## Rice production and trade in monsoon Asia.

The data at present available for the season 1938-39 cover over four-fifths of world rice production if China is excluded from the calculations and about nine-tenths if China is included. Assuming that production in the countries for which data are not yet available will show little change from last season, world production is probably slightly smaller than in 1937-38, when there was a coincidence of large crops in China, India and the Japanese Empire. The following table gives the latest estimates of production for the last five seasons.

*World production of rough rice* <sup>(1)</sup>  
(millions of pounds)

1934-35	. . . . .	275,930

(1) Not including Iran.

## Production in the major Exporting Countries.

Of the three major exporting countries only Burma has published final estimates of the 1938-39 crop. For Siam only the second estimates are yet available, while for French Indochina some of the most important statistical elements are lacking at this date.

In Burma the area harvested is now estimated at 12,529,200 acres, a very slight decrease on the maximum of 12,534,300 attained last season but 1.9 per cent. above the average of 12,296,000 for the five years ending 1936-37. The area sown was 12,820,100 acres, 0.3 per cent. below the 12,861,500 of last season but 1.1 per cent. above the five-year average of 12,682,000 acres. The area destroyed was the smallest of recent years, being only 290,900 acres, a decrease of 11.1 per cent. on the 327,200 of last year and one of 24.6 per cent. on the average of 386,000 acres. While the area destroyed rose considerably toward the end of the season, crop condition remained much better than last year and production attained the record of 13,388 million pounds of white rice and derivatives, 17.8 per cent. larger than the 11,363 million of 1937-38 and 10.0 per cent. larger than the five-year average of 12,168 million pounds.

*Area under Rice in India, Burma, Siam and French Indochina*

(in thousands of acres)

YEAR	India	Burma	Siam	French Indochina <sup>(1)</sup>
1938-39	72,574	12,820	8,758	(2) ...
1937-38	72,554	12,945	8,328	12,900
1936-37	72,295	12,634	8,051	13,945
1935-36	70,998	12,503	8,347	13,493
1934-35	69,731	12,688	8,245	13,184
1933-34	70,504	12,919	8,019	13,305
1932-33	70,180	12,702	7,942	13,526
1931-32	71,857	12,518	7,638	13,103

(1) Final estimates of area harvested, comparable statistics of sown area not being available. — (2) Rough estimate.

In Siam the area planted, 8,758,000 acres according to the first forecast, was the largest of recent years, 5.2 per cent. greater than the 8,328,000 of 1937-38 and 7.8 per cent. greater than the five-year average of 8,121,000 acres. Allowing for damage, which, according to the first forecast, amounted to 1,048,000 acres, not an exceptional figure, the area to mature was 7,710,000 acres, 6.0 per cent. above that of 1937-38 and 10.2 per cent. above the average. Production according to the second estimate was 8,164 million pounds of white rice and derivatives, over 8 per cent. above both that of last season and the five-year average.

For French Indochina data concerning the size of the crop are available only for Annam, where a very good crop has been obtained, thanks to favourable weather, except in the south, where flooding occurred, and for Tonkin, where production was exceptionally large, due both to the greater area sown and to favourable weather. Reports from Cochinchina, the predominant source of the rice exports of French Indochina and where a larger area was sown than last season or the average, have been very favourable, a crop larger than

(1) Exports *tel quel*, from Bangkok, December to November. — (2) Official estimates of export surplus. — (3) Rough estimate. — (4) Unofficial estimate of export surplus. —

that of last year, already above average, being expected in several provinces. In Cambodia, also a surplus-producing country, unit-yields of main-season rice were with few exceptions larger than were obtained last season.

In all three of the major exporting countries the crop thus appears to have been a large one, larger than obtained last season and, in Burma, the most important of the three, reaching a record level.

The surplus available for export from Burma is estimated at 7,952 million pounds of white rice and derivatives, 15.8 per cent. greater than the actual export of 6,864 million in 1938 and 6.9 per cent. above the average export of 7,437 million in the five years 1933-37: this season's estimated export surplus has been exceeded in recent years by actual exports only in 1934, when 8,465 million pounds were exported.

The first official estimate of Siam's export surplus, including carryover, was 2,819 million pounds of white rice and derivatives; subsequent revision of the production estimate so far does not give grounds for changing this figure. For French Indochina the export surplus is estimated unofficially at 3,968 million pounds. On the basis of these estimates the total surplus available for export this year from the three major exporting countries is 14,739 million pounds of white rice and derivatives, a figure in excess of that for 1938 and larger than the actual combined exports of any year since 1934.

#### Situation in the principal Importing Countries and in territories under Japanese control.

In India, the largest importing country, the area sown to rice is now estimated at 72,574,000 acres an insignificant increase on the corresponding estimate of 72,554,000 for last season but the maximum so far attained. The increase on the corresponding average of 71,716,000 acres for the five years ending 1936-1937 is 1.2 per cent.

The estimated production of 58,919 million pounds of white rice and derivatives is, on the other hand, lower than any in the last ten years with the excep-

#### *Production in the principal Asiatic rice-importing Countries, excluding Japan*

1932 . . . . .	2,107	2,993	1,145	1,024	887	28

(1) Tel quel, to 28 December. — (2) Net export.

In normal times China is the second largest importer of rice. According to a report of the United States Agricultural Commissioner at Shanghai, the 1938-39 crop has been a very large one, estimated at 3 per cent. above that of 1937-38, already a record, and there was also a large carryover. The large supplies available within the country would in themselves mean a persistence of the relatively low level of imports that has characterized the last three years.

*Imports into China*

(in millions of pounds).

YEAR	Total	French Indochina	Siam	Burma	Hong Kong
1938 . . . . .	895	230	408	166	24
1937 . . . . .	762	405	243	111	1
1936 . . . . .	684	249	388	43	1
1935 . . . . .	2,858	1,662	756	(1) 426	2
1934 . . . . .	1,700	755	761	(1) 141	29
1933 . . . . .	2,856	1,249	1,007	(1) 560	25
1932 . . . . .	2,998	1,010	858	(1) 956	153

(1) Although the statistics for these years included India with Burma it may be assumed that practically the entire import was from Burma.

As regards the rice-importing countries of the second rank, reports from British Malaya have indicated rather unfavourable weather and this may result in the necessity for larger imports.

In Java and Madura the area harvested in the calendar year 1938 was somewhat larger than that in the previous year. As regards Ceylon information

is not available. The most recent reports from the Philippine Islands indicate doubts as to the size of the crop, the harvesting of which was considerably hampered by typhoons and heavy rains. Should these conditions have resulted in a small crop, there would, as in 1936 and 1937, be a considerable net import.

### *Japanese Rice Supplies*

(in millions of pounds of white rice and derivatives).

(1) Not including Kwantung. — (2) Net export.

Production in the different countries of the Japanese Empire, though not reaching the exceptionally high figures of 1937-38, when an extraordinary crop was obtained in Chosen and large crops in both Japan and Taiwan, appears generally to be above the average. In Chosen, though the area under rice is below the five-year average, production remains at a level much above it, while in Taiwan large crops have again been obtained this season. The large crops of 1937-38 resulted in a large carryover and, taking this into account, supplies for the current season are reported to be more than adequate. Nevertheless the Japanese authorities are reported to be shipping rice from the Yangtze basin. Outside the lower Yangtze valley, however, the Japanese appear to have little or no control over the main rice-growing areas.

### Conclusion.

Summing up, supplies in the three major exporting countries, especially in Burma and French Indochina, appear to be large, those in the principal importing country, India, smaller than normal. Supplies in Japanese territories are also large, so that Japan is not likely to compete on the external market. Amongst other importing countries China, the most significant, appears to have a still larger crop than in 1937-38; on the other hand British Malaya and the Philippines may have to draw more than usually on outside supplies. The outstanding feature of the rice trade in 1939 is thus likely to be the balancing of the larger Indian deficit with the larger surplus of the three major exporters.

C. J. R.

## Current information on Rice.

*United States:* The Crop Reporting Board estimates, on the basis of farmers' reports on their planting intentions, that the prospective acreage planted to rice in 1939 will be about 1,006,000 acres. The acreage harvested last year was 1,068,000 acres.

\* Countries not included in the totals. — 1) Sown area. — 2) Planned. — 3) Final report. — 4) Area matured. — 5) Second report.

*British Guiana:* It was reported in January that rice milling had been affected by unsuitable weather conditions which, however, had been favourable for the planting of the short crop.

*Taiwan:* Sowing of first rice crop has commenced in the seedling beds in the northern section, and is finished in the central section.

*Netherlands Indies: Java and Madura.* — The Department of Agricultural Statistics of the Central Statistical Office communicates the following details on the rice area:—

	1939 acres	1938 acres
<i>Area harvested in January:—</i>		
Wet padi . . . . .	156,200	137,900
Dry padi . . . . .	18,800	18,000
<i>Area of standing crops at the end of January:—</i>		
Wet padi . . . . .	5,251,300	4,878,000
Dry padi . . . . .	866,900	903,700

*Indochina:* Yields of floating rice were particularly high in Cambodia, where harvesting and threshing were nearly finished. Sowing and transplanting of the dry-season crop were proceeding at the end of January. In Cochinchina harvesting of early rice was completed and that of mid-season rice was progressing rapidly at the end of January in good conditions. Standing crops were in good condition. Flowering and ripening of main crop occurred in good conditions and a good harvest was expected. The late crops were flowering and looked well. Condition of after-flood rice was normal. The harvest of late rices (eleventh and twelfth months) gave variable but, on the whole, apparently satisfactory yields.

Transplanting of fifth-month rice in Tonkin and first-semester rice (third and fifth months) in Annam was carried out in satisfactory conditions. As a result of rains, growth was vigorous and the crops in most provinces looked well. In Tonkin, however, the mildness of the temperature was unfavourable for growth.

*British Malaya:* The dry weather experienced in December did not appear to have affected adversely the padi crop; in fact, where the crop had reached the harvesting stage, the absence of rain was a great advantage. Harvesting was in full swing in most parts of the country and in some of them it had already been completed. Reports from the various districts were in general satisfactory.

### Current information on Potatoes.

*France:* In spite of excessive humidity, the preparation of the land was carried out in fairly good conditions in February and in the first decade of March.

*Hungary:* At the end of February, preparations for potato planting was nearly finished. The tubers of last year's crop have generally kept well during the winter.

*Italy:* Planting of early potatoes was continued in the first half of February in favourable conditions. A start was made with main crop plantings in the second half of the month.

*Argentina:* Potatoes were being lifted in the province of Buenos Aires in February. Yields were low in the south and average to good in the central and northern parts of this province. Yields were generally good in Santa Fé and satisfactory on the whole in other producing areas.

*Algeria:* The growth and yields of early varieties were unsatisfactory in parts of Alger and Oran. At the end of February the condition of spring crops was satisfactory.

*Tunisia:* The lifting of autumn potatoes and the planting of spring varieties was in full swing at the end of February. The cultivation of spring potatoes is increasing every year in the Bizerta area.

## Area and Production of Potatoes.

## The Acreage under Sugar-beet in 1939.

The first replies have now been received to the usual annual enquiry conducted by the Institute among the Governments of the various beet-growing countries and the associations of sugar manufacturers on the first estimates of acreage under sugar-beet this year.

The replies, however, are still too few to permit the construction of a table. Accordingly, the reports received are simply passed on and a table will be made when our information is completed next month with the replies from the remaining countries.

The Secretary General of the Ministry of Agriculture of Belgium communicates that in the first half of March the sowing of beet had not yet begun and accordingly it is not yet advisable to make an estimate. While it is believed that the poor financial results of the 1938-39 sugar season will affect unfavourably sowing for this year's crop, it must be remembered that 81 per cent. of the winter wheat crops and 97 per cent. of the winter barley were destroyed by the severe frosts of last December, and it is possible that a part of the area abandoned may be used for other crops, particularly sugar-beet.

The Statistical Office of the Kingdom of Bulgaria communicates that, in accordance with the agreement between the sugar manufacturers and the Ministry of Agriculture, the area to be planted to sugar-beet this year will be 18 per cent. larger than that of 1938.

The Finnish Association of Sugar Manufacturers reports that the acreage under beet this year will be about 35 per cent. less than last year.

The National Consortium of Sugar Manufacturers of Genoa writes that since, at the middle of March, the terms of the contracts for beet cultivation had not been settled, it is not possible to give precise estimates, but it is believed that the aggregate acreage in Italy this year may be about 11 per cent. more than last year.

The Statistical Bureau of the State of Latvia forecasts a small decline in area compared with last year.

The Central Statistical Office of the Polish Republic reports that the acreage under sugar-beet this year will be about 10 per cent. larger than in 1938.

The Secretary of the British Sugar Commission estimates that the beet area this year will be about 5 per cent. larger than last year.

The Statistical Bureau of the Central Trade Administration of Sweden states that according to the preliminary estimate the acreage under beet this year will be practically the same as in 1938.

The Secretariat of Swiss Farmers estimates that in Switzerland there will be an increase in acreage under beet of about 22 per cent. on last year.

The Association of Sugar Manufacturers of the Kingdom of Yugoslavia estimates that there will be a large increase in the cultivation of sugar-beet, amounting to about 50 per cent., over last year's figure.

Other countries have already announced that they will shortly send their first forecasts. It will thus be possible to publish in the April Crop Report a table giving this year's estimates of sugar-beet acreage compared with last years and the average.

E. R.

### Current information on Sugar.

*France:* In spite of excessive humidity, the preparation of the land proceeded in fairly good conditions in February and the first decade of March.

*Hungary:* Preparation of land for sugar-beet sowings began at the end of February.

*Italy:* The sowing of sugar-beet began in the second half of February.

*Argentina:* Sugar-cane crops in Tucumán, Salta and Jujuy were in very good condition in February as a result of the plentiful and well distributed rains of February. The growth of plantations, which had already been affected by the summer drought, was normal in February in the Chaco and the north of Santa Fé.

The condition of the sugar-beet crops was good in February in the irrigated areas in the south of the province of Buenos Aires and average in other places.

*British Guiana:* It was reported in January that weather conditions had been favourable for the coming cane crop.

*Jamaica:* It was reported in January that the sugar crop was starting and that all factories would be working by early March.

*St. Lucia:* It was reported in January that the growing sugar canes were recovering well from the floods.

*Trinidad:* It was reported in January that weather conditions were good for the commencement of the grinding of the 1939 cane crop but the abnormal weather conditions early last year had affected the sucrose content of the canes.

*Taiwan:* Growing conditions of the cane are generally satisfactory.

\* Not including in the total. — (1) Including Austria. — (2) Not including crops for seed. — (3) Sugar-beet for factories. — (4) Including beets for distilling. — (5) Figures established from the Plan.

*Netherlands Indies:* Rainfall was very uneven in the second half of February. It was heavy enough in some areas to cause flooding, as in Sidoardjo, while in others it was very light. Ploughing had begun in some places. Growth of cane was satisfactory in many areas and flowering was plentiful. Borers were reported from many fields but white lice and yellow streak were less in evidence.

In the first half of March also there was very irregular rain and there were reports of a large number of sugar-canes laid (*Aneta*).

*Production of Cane-sugar.*

(1) Approximate data.

*Indochina:* The yield from red cane for the extraction of molasses was average in Annam. The crop of green cane for consumption is variable. In Cochinchina, growth was affected in January by the cessation of the rains.

*Egypt:* Cutting of the sugar-cane crop destined for sugar factories is in full swing. Yield per acre is normal. Preparation of land for the new crop is progressing. Planting of early areas has been started in provinces of Qena and Asuan. Germination is satisfactory. The area under sugar-cane in 1938 is estimated at 70,800 acres against 70,400 acres in 1937 and an average of 67,600 acres in 1932 to 1936: percentages, 100.6 and 104.7.

*Mauritius:* It was reported in January that weather conditions had improved and prospects for the new crop were more hopeful.

## The World Wine Market in 1938-39.

### I. — REVIEW OF WINE PRODUCTION AND MARKETS IN 1937-38.

#### Situation at the beginning of the season.

The *wine market situation* was very much better at the beginning of the 1937-38 season than it had been previously. Stocks of old wine left over from the very full vintages of 1933 and 1934 (excluding the normal seasonal carryover between the two seasons), had been reduced to about 200 million Imperial gallons (230 million American gallons). World production during 1937, (excluding the U. S. S. R.), estimated at 4,050 million Imperial gallons (4,850 million American gallons), was rather below the average production of the previous five years but larger than the average quantity marketed during this same period, namely 3,960 (4,760) million gallons for both consumption and industrial use (for distillation, vinegar, etc.), but excluding quantities reabsorbed by means of special intervention on the market. The excess of supplies over what one may call the normal disappearance was thus about 200 (230) million gallons, this latter being an approximate rounded figure which may be compared with 750 to 850 (900 to 1,000) million gallons in the years 1934 and 1935. This represented a surplus of 5 per cent. of the average quantities marketed, against 25 per cent. at the beginning of the 1935-36 season.

The significance of this surplus, however, can only be appreciated in relation to certain very variable natural factors which affect the wine market and industry.

First, it should be noted that wine production during 1937 though not very poor, as in 1936, was low rather compared with the productive capacity of vines. The carryover, though rather small, threatened to overload the market heavily if the crop of the following year should prove to be larger than normal. In view of the fact that wine production seems to oscillate at present around an average figure of 4,100 to 4,200 million Imperial gallons (4,900 to 5,000 million American gallons), a further increase in the total volume absorbed for consumption and industrial use appeared necessary, not only to unload the market temporarily but also, and more particularly to ensure its future equilibrium.

(\*) Approximate figure.

(1) The years are those of the crops harvested in March-April in the Southern Hemisphere, and in October-November of the same year in the Northern Hemisphere. — (2) For Spain, Greece, Hungary, Germany and Luxemburg, original figures expressed in must have been converted into their equivalent of wine. — (3) Not including U. S. S. R. (80 to 100 million Imp. gal.) and certain unimportant producing countries (Malta, Japan, Bolivia, Paraguay, Madagascar, New-Zealand), of which total production is less than 2 million Imperial gallons.

Considering economic factors only, there was reason to fear on the contrary, a certain falling off in demand. Moreover, the comparatively high prices on the markets in a fairly large number of producing countries were naturally bound to limit or reduce commercial consumption, particularly as the recurrence of another world economic crisis seemed likely to reduce the purchasing power of certain classes of consumers. Unless a considerable drop in prices were to take place at the beginning of the season, the commercial consumption of wine seemed likely to reach only with difficulty the level of the previous season. Moreover, the production of alcohol from wine had been developed in several countries beyond the absorptive capacity of the market and there was a rather heavy accumulation of stocks of alcohol. Accordingly, demand for industrial use did not seem likely to reach a very high level.

The market position seemed therefore on the whole to be rather heavy and this impression was confirmed by the statistical position in the various countries.

Total supplies were definitely excessive compared with the maximum requirements of previous years in a fairly large number of countries, among which were the two normally exporting countries, Portugal and Australia, several other countries whose exports had recently become rather substantial, namely Hungary, Romania, Turkey, French Morocco and Chile, and also the United States and Brazil. This group is comparatively large and there may also be added the three large viticultural importing countries of Europe - Switzerland, Austria and Czecho-Slovakia - where supplies were above normal.

The total production of Portugal was large, exceeding by 12.5 per cent. the average production of the years 1933 to 1936, which was absorbed only with difficulty, but there was heavy overproduction of Madeira and Port wines in particular. Production of *vinhos verdes* from grafted vines in delimited regions was 38,610,000 (46,360,000) gallons against 18,410,000 (22,110,000) gallons in 1936 and that of Madeira was 2,475,000 (2,972,000) gallons against 693,000 (832,000) gallons in 1936.

Australian production was 28 per cent. larger than the 1933-36 average and quantities in bond on June 30, 1937 amounted to 18,700,000 (22,400,000) gallons against 7,900,000 gallons (9,480,000) on June, 1935. Surplus production in 1937 compared with the 1933-36 average was 35 per cent. in Hungary, where, however, stocks of old wines were low, 29 per cent. in Romania, where there were large stocks of old wines, 30 per cent. in French Morocco; 25 per cent. in Brazil and nearly 100 per cent. in the United States, where old stocks were also high. Fairly large quantities of old wines were carried over from the previous year in Switzerland, Austria and Czecho-Slovakia.

In a number of other large vine-growing countries, namely, France and Algeria, Greece, Bulgaria, Tunisia, Argentina, and the Union of South Africa, which are nearly all exporting countries, the statistical situation was undoubtedly better, but the equilibrium between supply and demand was rather precarious and it was not even certain that it could be maintained in 1937-38. This equilibrium had been achieved as a result of the comparatively poor wine production of 1937 in the first three of these countries and it could only be maintained if demand did not fall off as a result of the factors mentioned above.

In France and Algeria, the surplus over expected disappearance was officially estimated at 35.2 (42.3) million gallons, a relatively low figure, but it probably reflected a decline in consumption and seemed very significant since production was below the 1933-36 average and stocks of old wines almost normal. Production in Greece was below normal but stocks, especially of Samos wines, were rather high and possibilities of exports to France rather doubtful. Supplies in Argentina at 187.0 (224.5) million gallons, could only be disposed of were internal consumption continued to increase at the rate of earlier years. There was a similar position in the Union of South Africa resulting from the large production of the year.

The only countries where the statistical situation was really sound and where supplies were even lower than normal or predictable requirements, were Italy, Spain, Yugoslavia and, among the large importing viticultural countries, Germany.

Supplies in Italy were very light, namely, 748 (898) million gallons resulting from the year's crop and 81.4 (97.7) million gallons of old wines against an average disappearance of 858 to 880 (1,030 to 1,057) million gallons and a maximum of 924 to 946 (1,110 to 1,136) million gallons in 1936-37.

Yugoslavia had a very small outturn and small stocks. Supplies in Germany fell short of requirements owing to the expansion of domestic demand.

*International trade*, which had developed in a remarkable way during the two preceding seasons, was bound to show the influence of two factors, first, in accordance with what has been said above, the rise in producers' prices, and, secondly, an accumulation of stocks in the importing countries, particularly in Great Britain. Despite the probable increase in the demand of certain importing wine producing countries, some decrease in the total volume of trade was therefore to be expected, and there might also be expected certain changes in the channels of trade as a result of the almost complete disappearance of Spanish wines from a number of large importing markets and of certain factors affecting the trade relations between exporting and importing countries.

The rather depressed state of the market in the majority of countries and the prospects of a contraction of trade threatened to counteract the general improvement in the *economic condition* of the wine industries. Since the very severe depression of 1934-35, the situation had improved steadily in most countries, partly as a result of the increase in commercial consumption and more particularly as a result of the rise in prices. There was reason to fear that, considering only the normal economic conditions of the market, both factors in the earnings of wine producers in 1937-38, namely, the volume of sales and producers' prices might decline, at least to a slight extent. In other words the economic equilibrium of the wine industry seems as difficult to maintain as the statistical equilibrium of the market. If a severe crisis was not to be anticipated, at least a recession in the market appeared probable.

This would have taken place in fact, if the market had been free and unorganized, but this was not the case and it will be useful to review rapidly the principal features of the policy of protection and regulation of the market and of the organization of the wine industry and trade, which were extended and developed in 1936 and 1937.

### **Government intervention and the organization of wine production and trade.**

In general outline, without entering into the details of extremely complex legislation, Government measures may be classed under the following three headings.

#### *1. Control and regulation of wine production:*

(a) In regard to quality, limiting indirectly the volume of commercial production in almost all countries: fixing a minimum degree for commercial wines, restriction of production or prohibition of marketing of wines from ungrafted American stocks (direct hybrid producers) and wines from second pressing (second wine), regulation and limitation of mixtures or blends, protection of wines of

named origin and of known quality, organisation of the wine industry and its control (in Portugal, Greece and Italy). It should be noted with regard to this legislation that in those countries where it is most complete, particularly France, its application is considered as a fundamental factor in the disposal of supplies and in the equilibrium of the market.

(b) In regard to quantity, legislation is more rare: partial control in Portugal (Douro wines) and in Greece (Samos wines). Complete control in Argentina (elimination of a part of the crop of wine grapes).

2. *Measures for increasing onsumption:*

(a) On domestic markets, by the encouragement and financing of publicity: in France, Italy, Portugal, Hungary, Romania and Germany. Measures for developing subsidiary industries, particularly distillation, in Italy, Portugal, Spain, Hungary, Yugoslavia and Germany.

(b) On foreign markets, in almost all countries, by direct or indirect methods. For example, a system of indirect export bonuses exists in almost all countries (France and Algeria, Italy, Romania, etc.)

3. *Direct regulation and protection of markets:*

(a) Storage of supplies likely to be carried over from one season to another: in France and Algeria, Italy, Spain, Portugal, Greece, Hungary, Romania, Germany Switzerland and Australia. In the United States, Argentina, Australia and the Union of South Africa storage is normally done by industrial organisations;

(b) Absorption of supplies by distillation, if necessary, or, in some cases, by the concentration of must: in France and Algeria, Italy, Portugal, Spain, Greece, Hungary, Yugoslavia and Bulgaria;

(c) Staggering of sales or similar methods for regulating the marketing of supplies: in France, Algeria, and Italy; in Portugal, Greece and Tunisia on the domestic market, in Argentina (fixing the date at which the vintage of the year may be marketed);

(d) Maintenance of prices, either by staggering of sales based on a price agreement (France and Algeria) or by the fixing of a minimum market price (Italy, Hungary, Austria, Australia).

There are naturally remarkable differences in the nature and form of legislation enacting these various measures. In some cases, as in France, Algeria, Italy, Spain, Portugal, Argentina, Germany and French Morocco, it consists of a special wine statute. In other cases, it is contained in isolated or partial measures. Existing statutes were revised and developed in 1936 and 1937, including some which had only recently been promulgated, and many new measures were taken in the majority of countries in the course of these two years. For example, the wine statute in Italy was promulgated in June, 1937; in French Morocco in the same year; French legislation was motified in July 1937 and that of Argentina in January of the same year in Portugal, the *Junia nacional de Vinho* was created in October, 1937; in Hungary, a Consortium for the valorisation of viticultural products, a central cooperative of vine-growers, and

a wine publicity office were set up, and State control was more and more directly established over the market. Romania also entered the field with the establishment of the National Committee of Vine-growers; there were new measures in Greece, Switzerland, Austria and Turkey (re-organization of the alcohol monopoly). There was thus a very great increase in legislation affecting the wine industry and trade during the 1936-37 season. Most countries established a system of controlled viticulture, and this fact inevitably exercised an important influence on the disposal of wine during the 1937-38 season and on the market situation and the viticultural economy.

Parallel with this development, there has been an even more profound transformation in the viticultural economy. This transformation is partly the direct result of the measures taken to find immediate palliatives for the crisis of over-production and partly the result of a more completely organised programme of control. It is apparent in one these forms in the majority of viticultural countries, particularly in Europe and in certain overseas countries.

Certain subsidiary industries – particularly distillation of wine products and the extraction of grape-pip oil or cream of tartar – tend to occupy an increasingly important position in the general economy of a large number of countries. The narrow objective of absorption of surplus wine production and the enlargement of the industry's outlets have been replaced in a number of countries by a much larger conception which gives the by-products an important position in view of their use for fuel, lubricants or chemical production. The wine industry becomes a source of raw material of special value for supplying certain national requirements.

The by-product industries lose their character of subsidiary industries and acquire an importance of their own in national economics which tend more and more to autonomy and autarchy. In certain countries the production of by-products is regulated no longer in relation to the condition of the wine industry and as a means of absorbing surplus production, but as an important element in the national economy. In other words, the State takes control of the greater part of the production of wine alcohol for denaturation and for transformation into fuel not only for the establishment of reserves for exceptional requirements, but also in order to increase production in order to satisfy increased demand. One exception, however, should be noted, namely in Switzerland, where the State is attempting to discourage wine distillation, but this is the exception that proves the rule of the general trend of the wine industry, which is developing particularly in response to the requirements of pure alcohol in countries where the latter have increased.

Trade in wine has also become in a number of countries an essential part of the controlled national economy. Exports have been assisted and encouraged, and imports have been regulated and restricted, as important factors in foreign trade irrespective of the internal viticultural situation.

The wine industry and trade thus increase steadily in importance in the general national economy and their markets expand.

This development is accompanied by an organic transformation of the industry. It has involved a re-organisation of the alcohol market in France and

Italy (establishment of the *Ente nazionale dei distillatori di 2<sup>a</sup> categoria*) and in other countries (direct control of the alcohol industry). It has in particular made necessary the creation of new industrial plants in Italy and French Morocco. The wine industry and trade, moreover, have had to be equipped with cooperative cellars or warehouses and organised on a professional basis in Italy, Portugal, Greece, Hungary, Romania, Yugoslavia, Germany, and French Morocco to ensure storage, conservation of wines and the regulation of the market. There has thus taken place, under the more or less constant influence of the State, a veritable "industrialisation" of the viticultural economy on a general and advanced scale.

It is difficult to show statistically the increase in productivity of the distillery and other industries, for few figures are published. It may however be noted that the production of alcohol from wine (including not only the distillation of wines, but also of lees wine, of grape marc and second pressing wine) rose in France from an average of 15,530,000 Imperial gallons (18,650,000 American gallons) of alcohol 100° pure in 1929-30 to 1933-34 to an average 30,470,000 (36,590,000) in the last four seasons, and from a little over 100,000 *hectanhydres* in 1933-34 to 260,000 recently in Italy. The percentage of supplies (production plus imports) used in Germany for industrial purposes is at present estimated at between 40 and 60 per cent. whereas in 1913 it was less than 8 per cent. In Yugoslavia distillation absorbed up to 10 per cent. of the wine production and the proportion is about the same in French Morocco, showing a considerable relative increase. In Australia the amount of wine and lees of wine distilled has risen from 9,190,000 Imperial gallons (11,040,000 American gallons) in 1934-35 to 16,610,000 (19,940,000). On the whole it may be estimated that the average production of alcohol from wine has risen from 50 to 200 per cent. or in some cases even more in the last three or four years. The capacity of industrial production is considerably higher.

The other by-product industries have not developed to the same extent except in a few countries, especially Italy, where there is now being produced annually 2,200,000 Imperial gallons (2,500,000 American gallons) of grape pip oil and 4,400 centals of cream of tartar, whereas three or four years ago production was negligible. Germany unofficially estimated to produce 220,000 (260,000) gallons of grape pip oil. No statistics are available for other countries but, except perhaps for France and one or two other countries, production of pip oil and cream of tartar is not very large.

### The Commercial Year 1937-38.

The main features of the past season were as follows: a comparatively small total consumption compared with the volume of supplies; marked changes in the movement of the international trade in wine; greater security and even in some cases an improvement in the gross income of producers, with certain important exceptions.

*Internal markets: consumption and industrial uses.* — On the whole, internal wine consumption declined compared with the previous season. It continued to increase in certain minor consuming countries, particularly the United States and perhaps in Switzerland, Czechoslovakia and Belgium, but "paying" commercial consumption decreased in France and Algeria, Italy and Argentina and also appears to have been smaller in Greece, Romania and Yugoslavia. The rise in producers' prices for wine at the end of 1936-37 and certain general economic factors, which began to have effect at the beginning of the season, seem to have been the principal causes of this decline. In France, taxed commercial consumption was 1,099.9 (1,320.9) million gallons for the twelve months September 1937 to August 1938 compared with 1,117.5 (1,342.0) million gallons in 1936-37, 1,139.5 (1,368.4) million gallons in 1935-36 and an average of 1,093.3 (1,312.9) million gallons in the years 1929-30 to 1933-34. In Italy also, there was a slight decrease in the quantities subject to consumption tax on their entry into 94 provincial capitals (202.4 (243.0) million gallons against 204.6 (245.7) million gallons). In Argentina, internal consumption was only 149.6 (179.6) million gallons against 160.6 (192.8) million gallons in 1936-37 (August 1 to July 31) and 140.8 (169.1) million gallons in 1935-36. On the other hand, domestic consumption by the producers themselves, *i. e.* "non-paying" consumption was low in France-Algeria (about 370 (450) million gallons against 290 (340) million in 1936-37, 540 (680) million in 1934-35 and 407 (488) millions, on the average in the years 1929-30 to 1933-34) but fell off in Italy and Yugoslavia owing to the small volume of supplies. The aggregate actual consumption of wine seems to have been lower than in 1936-37 but to have exceeded the average of the previous period.

*The demand for industrial uses* was larger than in the previous season in certain exporting countries where distillation or concentration of must are resorted to for the absorption of surplus supplies. It increased in France-Algeria (production of wine alcohol was nearly 8.8 (10.6) million gallons in 1937-38, including 3.3 (4.0) millions compulsorily distilled, 2,490,000 (2,990,000) gallons in 1936-37, 37,370,000 (44,880,000) gallons in 1934-35 and 5,920,000 (7,110,000) gallons, on the average, in the five years 1929-30 to 1933-34) French Morocco, Hungary and Australia (the quantity of wine used for the manufacture of grape brandy and fortifying spirit was 17.3 (20.8) million gallons, that is 12 per cent. more than in 1936-37 and 80 per cent. more than the average of 1929-30 to 1934-35), but it increased also in Germany. Although production declined compared with 1936-37 in importing countries, namely, Italy, Yugoslavia and probably also the United States and Switzerland, it was higher than in previous years.

The increase in the quantity thus disposed of is hardly equal to the small surpluses in three of four viticultural countries of the Northern Hemisphere: France-Algeria, French Morocco and Hungary. In most of the other exporting countries it was insufficient to absorb the surplus either because distillation did not develop to the necessary extent or because stocks of alcohol were already excessive, or more often because its utilisation the use as fuel alcohol is very limited in these countries.

*International trade: imports and exports.* — On the whole, the demand for wine on the importing markets was about 6.5 per cent. below that of the previous year but it was large compared with the three previous years. The rather substantial changes in imports were due to special local causes. What is important is that considerable changes have taken place in the distribution of international trade, both in regard to quality and to countries of origin. These changes are the direct outcome of the special characteristics of the 1937-38 season.

The principal modifications in imports are seen first in the exchanges between the major viticultural countries: France, Italy, Portugal and their colonies. Imports from the home countries into the French and Italian colonies decreased but exports from Portugal to her colonies increased fairly considerably. These are the only changes which directly reflect the influence of the changes of internal prices to producers on consumption in the importing countries. Moreover, the imports from foreign countries into France decreased compared with 1936-37, but the volume imported in that year was exceptional in view of the abnormal deficit of Franco-Algerian production, and the 1937-38 figure may be considered as normal, corresponding to the conditions of demand for quality wines of special origin and to the requirements of trade relations with certain countries. In addition the same tendency was shown in the imports of the United States. A decrease took place in the imports of Great Britain and certain non-viticultural countries, which are minor importers, namely, the Netherlands, Denmark, Norway and Egypt, but in the case of Great Britain this decrease reflects the existence of very large stocks held in bond at the end of the 1936-37 season and is partly due to the difficulty of trade with Spain, which was a large supplier of these countries. Several of the non-viticultural countries, including Belgium, Poland, Finland and Sweden increased or maintained their imports. Most of the importing viticultural countries, including Switzerland, Austria, Malta and in particular, Germany also took more. These increases did not offset the decreases that occurred elsewhere but demand varied within narrow limits, and its variations do not show a general movement such as occurred in previous years.

The only noticeable tendency is a slight downward movement. This tendency might undoubtedly develop if prices remain high in certain large exporting countries and if the rise was accentuated, but so far the effect of the rise in nominal prices to producers on the volume of consumption has been slight or even, in the importing countries, largely offset by the depreciation of the currency of certain exporting countries and by measures taken to assist exports. In fact, expressing producers' prices in the currency of the importing countries and taking into account the advantages of clearing agreements and other assistance to exports, it is seen that the modifications in these actual prices on the import markets do not correspond with those in nominal producers' prices.

The changes that have occurred in the provenance of imports are even more important than the changes in the total volume of international trade. These changes are very definite and constitute one of the most important features of the year from the point of view of international trade. On the one hand, there was an appreciable drop in exports, not only from Spain, but also from Italy and Portugal to foreign countries and on the other, an increase in exports

## Imports of Wine.

from France, Hungary, Greece, North Africa, Chile, the Union of South Africa, Romania, Bulgaria and even Turkey and Palestine.

The relative level of prices on import markets and the economic relations between exporting and importing countries partly explain individual variations in exports. Moreover, the very substantial decline in the shipments of red wines from Spain has naturally turned demand towards wines of similar quality. Wines of the south of France, of North Africa and South Africa have benefited on several markets from the disappearance of Spanish red wines. These obvious causes, however, were not the only ones modifying demand trends. Demand itself seems to have undergone a rather remarkable qualitative transformation.

There has been a general decline in the imports of fine and speciality wines, including wines with appellation of origin, sparkling wines and liqueur wines while the demand for ordinary wines, particularly those with a high alcoholic degree suitable for diluting and industrial purposes, has increased very substantially. This is clear in the imports of Germany, Belgium and even Switzerland, in the exports of Portugal, France and Greece (a higher proportion of wine in barrels) and, in those of Italy (a greater decrease in exports of special wines, vermouths and white wines than in those of ordinary red wines) and in the growth in the exports of the secondary exporters of the Denube Valley, Asia Minor and North Africa. In some cases, lower imports of fine and speciality wines can be attributed to the existence of stocks built up in years of low prices but it appears from the nature of the trade movement that a much wider and more stable development is taking place.

This development is the reflection of a change in consumption and of the organisation of the wine industry and trade in several of the large importing countries. It is well known that, while the British market is still essentially a market for quality wines of known provenance, in many other countries, especially Germany, including Austria, and Switzerland, the wine trade is tending towards the production of blended or diluted wines, absorbing the local production, supplemented by foreign wines. Further, especially in Germany, the national industry of sparkling wines, vermouths, vinegar, and wine alcohol has expanded considerably. This has reduced imports of such products and increased those of ordinary wines which are now purchased as raw materials for their sugar, alcoholic and acid content and no longer for consumption in the ordinary sense.

This is an important development for, though it has the effect of stimulating demand quantitatively it decreases the value of imports and changes the direction of exports. Demand is tending more and more towards high degree wines for diluting and wines for distillation and tries to acquire them at lower prices. From the standpoint of the exporting countries, this transformation accentuates the character of exports as a means of disposing of surpluses. Thus, in addition to *quality* exports, there are *quantity* exports the main purpose of which is to sell abroad at very low prices, for industrial purposes, the surplus quantities which the internal market could absorb only with difficulty.

The trend of demand qualitatively, together with the level of real prices on import markets and the almost complete cessation of exports of ordinary red wine from Spain, accounts for the changes in exports. These include a decrease

*Exports of wine by principal exporting countries.*

1) Including exports to the Italian colonies: 10,600,000 gal. in 1936-37, 10,010,000 gals. in 1937-38 — 2) In-  
cluding exports to the French colonies: 5,950,000 gals. in 1936-37, 5,650,000 in 1937-38. — 3) Including exports  
to the Portuguese colonies: 3,930,000 gals. in 1936-37, 4,450,000 in 1937-38. — 4) The French figures for imports  
from these countries are taken in the absence of indications of destinations in the monthly statistics for certain  
years and, in the case of Spain, in order to account more exactly for exports to Switzerland across France;  
total Spanish exports to France and Switzerland are practically equal — at most 760,000 gallons — to the  
total French and Swiss imports of Spanish wines; exports from Portugal to France and imports of Portuguese  
wines into France practically coincide. — 5) From 1927 to 1929, exports by calendar year. — 6) July 1-June 30,  
failing monthly or quarterly statistics. — 7) Exports 1 October 1935 - 30 April 1936: 16,920,000 gallons. Imports  
of Spanish wines into the six principal countries importing Spanish wines (about 80 % of the total export): in  
the five months ending 30 Sept. 1936 8,760,000, in the twelve months ending 30 Sept. 1937 16,850,000 gal., in the  
twelve months ending 30 Sept. 1938 7,260,000 gals. Approximate estimate for the calculation of the totals:  
27,500,000 gal. in 1935-36. 21,000,000 in 1936-37, 9,500,000 in 1936-37. — 8) Excluding exports of Algeria and  
Tunisia to France (almost entirely free of duty and about 4,400,000 gallons at half duty). — 9) Calendar year. —  
10) Approximate rounded figure, including Spanish exports calculated as indicated in note 7. — 11) Representing  
nearly 99 % of total world exports. — 12) Figure rounded at 0.5 %. — 13) Total exports of countries other than  
France and Algeria, less those destined for France, and related to the total production of these countries.

in exports from Italy and Portugal, an increase in exports from France, Hungary, Greece, North Africa, Romania, Yugoslavia, Bulgaria and even Turkey, Palestine, Chile and the Union of South Africa.

*Prices.* — Price movements show even more clearly than trade trends the direct and indirect results of market regulation and protection.

In most of the countries of the Northern Hemisphere, including some which held supplies in excess of their requirements, prices showed a marked rising tendency at the beginning of the year. After a slight fall in several countries, prices again rose as a result of the late spring frosts. At the end of the year, prospects of large crops caused a weakening which in some countries, especially Romania, was serious enough to bring prices down nearly to the level at which they began the year. This was the trend in most of the countries of the Northern Hemisphere. In some countries, however, particularly Portugal, there was an almost continuous fall (averaging 40 per cent. in the country as a whole between October 1937 and September 1938; in the Porto and Aveiro districts the fall, compared with October 1936, was respectively 55 and 53 per cent for white wines and 60 per cent. for red wines). Prices also fell steadily in many of the countries of the Southern Hemisphere, particularly in Argentina (26 per cent. between May 1937 and September 1938 at Mendoza) and in Chile (18 per cent. for *Burdeos* wines and 25 per cent. for Semillón wines between January 1937 and September 1938 at San Xavier).

If, instead of the curve of monthly prices, the average price of the year is considered, it will be noted that it was above that of the previous year in nearly all countries and that there was a general improvement in the trade situation. The reverse was true of Portugal (28 per cent. for the country as a whole; 46 per cent. for white wines and 51 per cent. for red wines in the Porto district), the United States, Chile (about 15 per cent.) Czechoslovakia and probably Greece and Australia. The extent of the rise in other countries varied. In France, Algeria, Tunisia, Argentina, French Morocco and Romania it was slight (7 to 15 per cent.) and almost corresponded, at least for ordinary wines, to the rise in the general level of domestic prices. In the first four of these countries prices had risen sharply in 1936-37. Moreover, the rise was greater in the case of special wines owing to their excellent quality. On the whole the increase was greatest in Yugoslavia, Germany and Switzerland. It was relatively large in Italy (50 to 100 per cent.), Hungary (about 75 per cent.) and in Spain.

### General Statistical and Economic Review of the Year.

The foregoing considerations show that the results of the year, considered from the statistical standpoint of disposal of supplies, were different from the results from the point of view of gross economic returns.

*Disappearance* of supplies, on the whole, was insufficient, having regard to their initial volume. Total marketings were undoubtedly larger than those of 1936-37 but below the previous average. They do not appear to have reach-

ed 4,000 million Imperial gallons (4,755 American gallons) whereas supplies, excluding normal carryover, were approximately 4,200 (5,020) million gallons. Stocks at the end of 1937-38 were 66 to 88 (79 to 106) million gallons larger, the total exceeding 220 (264) million gallons.

Consumption remained at low levels because supplies in the major producing and consuming countries—France, Algeria, Tunisia, Italy and Spain—were low and because the invisible consumption in the homes of producers was limited in these countries. On the other hand, Yugoslavia and Germany, both “deficit” countries at the beginning of the year, appear to have preserved statistical equilibrium on their markets. What is more significant is that the surplus supplies seem to have been absorbed in Hungary and in the secondary viticultural countries, including Switzerland, French Morocco, Turkey and the Union of South Africa. These are among the satisfactory aspects of the year. In a fair number of countries, including the major producing and consuming countries, the year left no surplus stocks of old wines over and above the normal carryover. In some cases, the carryover was hardly assured.

Nevertheless, demand was insufficient in nearly all countries which held supplies above the normal. It expanded in some cases but to a very slight extent compared with the increase in supplies. More frequently, demand fell off; this occurred also in Greece where supplies were about average. Thus, in Portugal, Romania, Greece, Czechoslovakia, the United States, Argentina, Brazil, Chile and Australia, the year ended with increased surpluses in some cases large. Supplies in bond in Great Britain also increased and reached a very high figure. The surplus supplies held at the end of 1937-38 in this group of producing and non-producing countries represented about one third of their annual consumption in the last two years.

The general development of the situation during recent years seems to indicate that overproduction still exists in a fairly large number of countries, including Portugal, Romania, the United States, Argentina, Brazil, Chile French Morocco and Australia, and that in certain other countries (Greece, Bulgaria, Yugoslavia, Switzerland and Tunisia) the equilibrium between supply and demand is still unstable and subject to a serious danger of a large crop or of a weakening in demand either on the domestic or on the foreign markets. The equilibrium seems to be more stable in some of the important viticultural countries, including France, Algeria and Italy as well as Hungary, Germany, Austria and the Union of South Africa.

Though difficult to determine, the economic situation of the wine industry, seems to have been more affected by the policy of organization, protection and support. This is normal, for it was the principal object of the measures taken.

Not even an approximate estimate of the gross returns of the wine industry can be made, but an attempt can be made to calculate the relative magnitude of these returns in 1937-38, taking account of the commercial consumption (the consumption of home-produced wine on the domestic markets, exports, and the utilisation of wine and its by-products by derivative industries), the average price obtained during the year for the principal qualities and markets, the variations in the price levels of agricultural products and in the level of wholesale prices in general.

There is no absolute correspondence between the economic returns on the one hand and the statistical situation of disappearance on the other. Broadly speaking, it is true that gross returns seem to have increased or to have continued high in countries where the statistical situation was satisfactory or better. In other countries it decreased, but there were two exceptions namely, Romania and Argentina, where the average producers' prices were higher for the year as a whole. The two factors, variation of actual prices and variation in commercial consumption rarely work in the same direction. This seems to have occurred only in Hungary and Switzerland with a resultant appreciable increase in actual gross returns and in Portugal, Argentina and perhaps Greece with the opposite result. In most cases there was a partial compensation leaving a varying margin of profit or loss.

In France, if allowance is made for all factors, actual gross returns seem to have increased, owing to greater consumption of wine of recognised origins and of special wines and to the very large increase in prices. Returns were relatively high in Italy where the relatively considerable increase in producers' prices more than offset the small decrease in domestic consumption and the larger decrease in exports, with the result that gross returns increased from 30 to 40 per cent. Gross returns appeared to have increased also in Spain, Bulgaria and Germany including Austria, owing to the increase in prices and despite the decrease in the quantity of national wines sold in most if not all of these countries. In Algeria actual gross returns were very high and certainly larger than in 1936-37 owing to the increase in total commercial consumption. The same is true of French Morocco. In both these countries, after allowing for prices paid for compulsory distillation and exports and for loans to producers, the rise in the actual average price per hectolitre of the whole commercial consumption was little or nothing compared with 1936-37. On the other hand, in the United States, Czecho-Slovakia, Australia and Chile, the fall in producers' prices was partially or completely offset by the increase in commercial consumption.

Gross returns showed wide variations in Italy, Hungary, Yugoslavia, Romania, Bulgaria and Algeria, in all of which there was a substantial increase. In Portugal and Argentina there was a rather considerable decrease. Returns were at about the level of 1936-37 in France, Algeria, Tunisia, Greece, Germany, Czecho-Slovakia and the United States. On the whole, the year 1937-38 was better from the point of view of returns than from the statistical point of view of disappearance of supplies.

## II. — THE GENERAL SITUATION OF PRODUCTION AND MARKETS AT THE BEGINNING OF 1938-39.

### Statistical Position.

Production in the Southern Hemisphere in 1938 was 375 to 400 million Imperial gallons (449 to 476 million American gallons). The production obtained in the autumn in the Northern Hemisphere seems to have been between

\* Countries excluded from the totals for the Northern Hemisphere.

† Must coefficient used for the totals: Germany 93 %, Greece 101 % (weight into volume), Hungary and Luxemburg 94 %.

(1) Excluding the land of Austria. — (2) Approximate estimate. — (3) Incomplete average; Spain 1932/1935, United States 1931, Union of South Africa 1929-30/1931-32. — (4) Crop declarations for tax purposes. Incomplete figures, the total production being about 66,000,000 Imp. gallons larger. — (5) Not comparable with previous figures, owing to changes in statistical methods. — (6) Adjusted total allowing for the statistical deviation in the data of Italy. — (7) Calculated on the basis of the Prorate Program for the wine industry. — (8) Including musts "mutés" by means of alcohol. — (9) Including countries which are not included in the totals for the Northern Hemisphere.

3,960 and 4,070 million Imperial gallons 4,755-4,667 million American gallons), making a total of 4,400 (5,300) million gallons in round figures excluding the production of the U. S. S. R. Allowing for the stocks existing at the end of the previous year, available supplies, excluding normal carryover, were at least 4,620 (5,550) million gallons and perhaps 4,730 (5,680) million gallons. Taking the average figure of total disappearance during the last six years (about 3,960 million Imperial gallons or 4,755 million American gallons) the supplies thus estimated would appear to leave a surplus of 660 to 770 million Imperial gallons (793 to 935 million American gallons). On the whole, therefore, overproduction is considerable. The surplus, though it is not as large as that of 1935-36 (1,430 million Imperial gallons or 1,717 million American gallons), is still of very large dimensions.

The size of the surplus and the proportion it bears to the normal disappearance are indicated below, the figures being rough estimates except in the case of France, Argentina, Australia, Chile and Uruguay.

### Surpluses at the beginning of 1938-39.

#### *Major exporting countries:*

France-Algeria: 180 (216) million gallons, or 11 per cent. of the normal disappearance.

Italy: nil.

Spain (not known)

Portugal: 90 to 110 (108 to 132) million gallons, or 60 to 70 per cent.

Total: 290 (348) million gallons, or 8.5 per cent. of the normal disappearance.

#### *Medium producing and exporting countries:*

Greece: about 20 (24) million gallons, or 30 per cent. of the normal disappearance.

Hungary: nil.

Tunisia: about 10 (12) million gallons, or 30 per cent of the normal disappearance.

French Morocco: about 7 (8) million gallons, or 50 per cent. of the normal disappearance.

Chile: about 4 (5) million gallons, or 30 per cent. of the normal disappearance.

Union of South Africa about 7 (8) million gallons, or 15 per cent. of the normal disappearance.

Australia: about 15 (18) million gallons, or 65 per cent. of the normal disappearance.

Total: about 63 (75) million gallons, or 25 per cent. of the normal disappearance.

*Medium producing and minor exporting countries:*

Romania: 90 to 110 (108 to 132) million gallons, or 50 to 60 per cent. of the normal disappearance.

Yugoslavia: about 10 (12) million gallons, or 10 to 15 per cent. of the normal disappearance.

Bulgaria: about 10 (12) million gallons, 30 to 40 per cent. of the normal disappearance.

United States: 90 to 110 (108 to 132) million gallons, or 60 to 85 per cent. of the normal disappearance.

Argentina: 86 (103) million gallons, or 55 per cent. of the normal disappearance.

Brazil: 33 (40) million gallons, or 50 per cent. of the normal disappearance.

Uruguay: 2 (3) million gallons, or 20 per cent. of the normal disappearance.

Total 321 to 361 (386 to 434) million gallons, or 60 per cent. of the normal disappearance.

*Importing countries:* Excess of supplies or stocks compared with previous average:

Germany (including Austria), Switzerland, Czecho-Slovakia: little or none.

Great Britain, Belgium and other non-producing countries: about 10 (12) million gallons, or about 30 per cent. of consumption in 1936-37 and 1937-38.

The problem at the beginning of the preceding year, namely, to assure statistical equilibrium by increasing total disappearance and to raise producers' prices to a satisfactory level, or to keep them at such a level, thus appeared to be much more acute and much more general. The year 1937-38 showed that this double objective could be reached only by stringent regulation of production and trade and by direct Governmental intervention in markets. In the present circumstances it is impossible to expect sufficient development in consumption and industrial utilization even with an appreciable reduction in producers' prices; and, in any case, this solution would reduce the gross returns of growers which would be contrary to the viticultural policy of all countries. Since the viticultural policy has made this its principal objective, that is, to support or increase producers' prices, there is no prospect of increasing "paid" commercial consumption. On the contrary, this consumption seems likely to decrease generally as the result of the rise in prices in 1937-38 with certain exceptions already noted, the effect of which may be offset by other factors of depression on home markets.

The demand for industrial purposes apart from the direct interventions of Governments is also likely to be smaller and barely equal to what it was in 1937-38, partly owing to the existence of large stocks of alcohol and partly to the rise in the prices of this commodity. Finally, the demand of the importing markets does not seem likely to increase substantially. Though this demand may increase in certain importing viticultural countries, particularly Germany, the rise in producers' prices and the large stocks held in several countries are likely to bring about some weakening. As regards producers' prices, it

must be remembered that the effect of the depreciation of certain countries, at first very strong, tends to weaken and even to disappear. The only outlet capable of expansion is consumption in the homes of growers themselves. Consumption of this kind yields nothing and is of no economic interest and any expansion would apparently be quite insufficient to absorb an appreciable fraction of the surplus. At most it might absorb 110 to 130 million Imperial gallons (130 to 160 million American gallons).

In view of such a situation in the majority of countries, it was natural that the solution of the wine problem should be sought still more than in 1937-38 in the restriction of production, the utilization of the surplus by compulsory distillation, the elimination of some quantities from the market and the carryover of part of the surplus on the one hand and by the support of prices on the other, all measures to be accompanied by market regulations and methods of assisting exports and internal consumption.

### **The application and extension of Industry and Trade Regulations in 1938-39.**

In several countries the regulations already in force were continued, but at the end of 1937-38 these measures were revised, reinforced and made more elastic in France, Algeria and French Morocco. In Italy the law of July 1937 had not yet been applied in its entirety. In most cases new regulations were applied.

In *France* and *Algeria* the viticultural statute, according to the official expectations, was to provide, on the one hand, for the removal of 143 million Imperial gallons (172 million American gallons) by means of compulsory distillation, and on the other hand, for confining in producers' cellars of 33 million Imperial gallons (40 million American gallons) which will thus be provisionally removed from the market and probably carried over to the next year. The total corresponds to the surplus available supplies according to the official estimate. The quantity of alcohol taken over by the State for defence requirements has also been increased, which makes an additional outlet for the large expected production of alcohol. Moreover, the graduation of sales is to assure a minimum price of 16 to 17 Frs. per degree-hectolitre for ordinary wines on the markets of the Midi.

*Italy* appears to have no surplus supplies. The change in the statistics of production following the intervention of the system of compulsory production returns, makes it impossible to determine the size of production in 1938. Though this production was at least 10 per cent. larger than that of 1937, it seems hardly larger than the average of the years 1932-36. Stocks of old wine at the beginning of the season appeared to be small. However, in pursuance of the law of July 1937, it was decided that distillation should supply 5,720,000 Imperial gallons (6,870,000 American gals.) of wine alcohol. For this purpose 10 per cent. of the commercial production of the year was confined in producers' cellars at the beginning of the year, which would give supplies of about 70 (80) million gallons, but it was estimated that it was sufficient to distil half

of this quantity, the remainder of the wine alcohol to be provided by the distillation of poor quality wine (lees, second pressings and grape marc). At the same time, the production of grape pip oil was to reach 2,200,000 (2,600,000) gallons during the year. In view of the general market situation, the larger commercial supplies and the declining tendency of commercial consumption, it seemed difficult to maintain the high prices reached during the previous year. Attempts to organise the industry and trade by means of *consorzi*, *monopoli* and the corporative control of the market were to be accentuated for this purpose. Exports presented another serious problem. Organisations for study, propaganda and control were set up either by the *Federazione nazionale fascista dei commercianti in vini* (Expert committee for exports of wine and similar products) or by the Ministry of Foreign Trade and Exchanges (Study committee for each country). Plans to fix minimum export prices were made.

In *Spain*, the main problem was exports and the conclusion of trade agreements between Burgos and Spain's principal customers—Switzerland and Germany. At the beginning of the year it seemed that this problem was approaching a solution.

In *Portugal* where a record production of 2 million 'pipes' was expected, or about 240 (290) million gallons, a series of measures were taken to limit commercial production and to support the market through a corporative organization with larger and less immediate objectives. Production of Port wines was limited to 40,000 pipes, equivalent to 4,800,000 (5,800,000) gallons, a very small figure and lower than in any of the preceding years. The *Junta Nacional do Vinho*, set up in October 1937, was to withdraw 300,000 pipes, or 36,300,000 (43,600,000) gallons from the market, thus reducing the available production by 15 per cent. Steps were taken to expand exports and to maintain internal prices at a minimum of 50 escudos per hectolitre to producers.

In *Hungary*, where there was no surplus and where the prospects were good, no exceptional measure, such as the concentration of musts, was necessary. However, a minimum price was fixed, on agreement between the Government and the interested bodies, by the Consortium for the valorisation of wine products (420 fillers per degree-hectolitre for musts, 200 fillers for wines and 10 pengöes per quintal of wine grapes).

In the *United States* a plan followed the formation of a compulsory union of wine makers. This provides for the limitation of production by a quota system for grapes used for wine (120,000,000 centals or 600,000 short tons, equivalent to 40 per cent. of the 1937 production) and by the absorption of the surplus, partly for distillation by industrial wineries. The programme also provides for energetic propaganda, financed by the banks, to encourage wine consumption.

*Argentina*, where surplus supplies on August 1 were rather large, adopted a number of serious measures. The opening of the commercial year 1938-39 was shifted to November 1. This had the effect of reducing the surplus statistically to 62 (74) millions gallons and was equivalent to a temporary elimination of the 1938 vintage ensuring the disposal of stocks of old wines.

Producers in the provinces of Mendoza and San Juan were required to deliver to the *Junta nacional de Vinos*, as a free loan, 15 per cent. of their production. This absorbed 29 (34) million gallons which will be eventually eliminated from the market. The Junta was authorised to purchase 22 (26) million gallons at a fixed maximum price. This quantity was to be removed from the market and disposed of in a manner to be determined by the size of future crops. The remainder of the statistical surplus of 62 (74) million gallons, or about 10 (12) million gallons will be held by producers.

Several other countries have taken steps to dispose of their surpluses in the form of fuel alcohol. They include French Morocco, where the production of alcohol from wine is to be raised to 3,300,000 (4,000,000) gallons against 1,200,000 (1,500,000) gallons in 1937-38; Australia, where the Federal Viticultural Council has been replaced by the Australian Wine Council which has wider powers and which is to prosecute the extension of the use of wine alcohol as fuel; Uruguay, where a large surplus is to be converted into alcohol.

In addition to these direct and clearly defined measures, mention must be made of the development and extension of the existing organisations and measures in Greece (creation of the Wine Institute), Romania and Yugoslavia.

Thus, the wine industry and trade seem to be even more closely regulated than in 1937-38. The production of wine alcohol may be expected to be at least twice as large as in 1937-38.

Allowing for the quantities eliminated in a more drastic manner, it may be reckoned that about 220 (260) million gallons, or a little less than a third of the surplus, will be thus disposed of. In some countries, part of the surplus will be provisionally blocked and withdrawn from the market. The latter represents a necessary but speculative anticipation of small or less abundant crops and has the effect of stabilising the market or supporting prices.

### **The Market Situation in the first months of the year.**

It is not easy at present to ascertain the results of the measures enumerated. Commercial consumption is declining in France and, despite the greater demand for distillation, the disposal of wine is very irregular. The figure is high in Algeria and in the minor producing areas in the centre, the west and the east of the home country, but it is low in the south.

International trade seems to be stationary on the whole. Great Britain and Belgium, in particular, imported less in the first months of this year than in the corresponding months of 1937-38. There was a large increase in Germany and Switzerland however. In the exporting countries, the most striking development is an appreciable recovery in German imports from Spain.

There was a rather general fall in producers' prices at the beginning of the year in the countries with surplus supplies. In Italy this decline was 10 to 20 per cent. In France, however, prices of ordinary wines on markets in the midi rose in February to the level reached in September 1937 and this rise

extended to other places, for Bordeaux wines in particular. Prices in Algeria reached a very high level. They are firm with a rising tendency in Hungary.

These indications however, are fragmentary and can give only a very incomplete idea of the general course of the commercial year.

P. DE VIGUERIE.

### **Current information on Vines.**

*France:* It is not possible until growth begins to estimate the extent of the damage done by the winter frosts to vines. The damage, moreover, seems to be extremely variable from one district to another and according to the exposure of vines and stocks. In the first few days of March, growth began in the south but was checked by March 7 by a return of cold north winds. Seasonal work, particularly pruning, progressed very well in February. At the end of the month, pruning had been completed normally in the south.

*Greece:* Vines benefited from rain towards the end of February and at the beginning of March.

*Argentina:* In February the maturation of wine varieties of grapes continued in good conditions. Crop prospects in the country as a whole were good for these varieties. Picking of table grapes was in progress in all areas, and yields were good except in San Juan Province where vineyards were affected by drought, high temperatures and winds.

*Cyprus:* The production of grapes in 1938 is estimated at 1,408,200 centals (including 772,200 centals of grapes for wine) against 765,000 in 1937 and an average of 1,184,500 on the average 1932 to 1936; percentages, 184.1 and 118.9.

*Algeria:* Pruning and replanting of stocks were almost finished at the end of February. In some vineyards in Alger the mild weather caused premature sprouting of buds, which may be damaged by frost.

*Tunisia:* Pruning and planting of American vines was carried out at the end of February in the Bizerta and Tunis districts. Surface hoeing was in progress. Stripping was just beginning on early stocks.

### **Current information on Olives.**

*Argentina:* Olive crop prospects were good in February in the main producing areas.

*Algeria:* Trees were being pruned at the end of February. Improved prunings are expected to follow the instruction given in some districts.

*Tunisia:* Pruning, planting and other work were in progress at the end of February.

*World Production of Olive-oil.*

\* Rough unofficial estimate. — (a) Data calculated on the basis of olive production.

**Current information on Flax.**

*France:* Despite excessive moisture, preparation of the land was done in good conditions. It seems that sowings will cover an appreciably larger area than that of last year and the average.

*Italy:* The spring sowing of flax for fibre began in the second half of February.

*United States:* The Crop Reporting Board estimates on the basis of farmers' reports on their planting intentions that the area to be sown to linseed this year will be about 2,032,000 acres. This is considerably larger than the 1,096,000 acres actually sown in 1938 but only moderately above the average planted area of the five years 1933 to 1937 (1,937,000 acres).

## Current information on cotton.

*United States:* During the week ended March 2 preparations for planting in some Southern sections were becoming abnormally delayed although some cotton had been seeded in the extreme south of Texas. Persistent rains over extensive areas were retarding farm work. During the week ended March 15 cotton planting preparations in most of the South made considerably better progress. Planting preparations began in the southeastern part of the Belt and much ground was seeded in the extreme southern part of Texas.

Summary of the Cotton Reports  
issued by the Government of the United States, during  
the cotton season (August 1-July 31).

(1) Area in cultivation on July 1 less the ten-year (1928-37) average abandonment 2.1 per cent. — (2) Area actually harvested. — (3) Ten-year (1927-36) average. — (4) In bales of 478 lb. net weight and exclusive of linters. — (5) In running bales, counting round bales as half bales and exclusive of linters. — (6) Total abandonment after July 1: 1.7 per cent. — (7) Abandonment: 3.1 per cent. — (8) Counting round bales as half bales and exclusive of linters.

*St. Vincent:* Weather conditions in January were rather unfavourable for the cotton crop and peasants' fields in particular suffered. It was feared that any further rainy weather might cause serious losses from boll rotting and shedding, and expectations were for a crop much below that of 1937-38 which was obtained from a rather smaller acreage than that planted in 1938-39.

*Egypt:* Sowing of the cotton crop has made but little progress in Upper and Middle Egypt during February, notwithstanding early tillage, owing to the following causes:

(1) Variable weather conditions during certain days.

(2) Belated water supply of many canals in certain localities.

(3) Abstention of growers from early sowing for fear of what happened last season, namely, that they would be compelled to resow early areas.

Only 7 per cent. of the total area had been sown up to the end of the month, as against 13 per cent. last year, and 18 per cent. in 1937, during the corresponding period. Germination is so far satisfactory.

Cotton ginned up to the end of February, in bales of 478 lb. net weight, was as follows:

Varieties	1939	1938	1937	1936	1935	1934	1933

\* Countries not included in the totals.

(1) See: *Summary of Government Cotton Reports*. — (2) Fourth report, referring to the entire cotton area of India. — (3) Exports.

ganda Province the abnormal rains benefited late plantings, but interfered somewhat with harvesting from the early sowings. On the whole, crop prospects seemed slightly less favourable than before. It was reported in January that the dry weather continued to have an adverse effect on the late plantings. It was not anticipated, however, that the total crop would fall far short of the original estimate, already published and appearing in the general table.

### Current information on Hemp.

*Italy:* Hemp sowings were started in favourable conditions in the second half of February.

## Current information on Tobacco.

*Hungary:* At the end of February the preparation of seed-beds for tobacco had begun.

*Argentina:* Except in the Mission Territory, the condition of the tobacco crop was generally poor in February owing to the drought of the earlier months which impeded transplantation and growth of plants.

*United States:* The Crop Reporting Board estimates that about 1,695,000 acres will be planted to tobacco in 1939. The harvested area in 1938 was 1,626,700 acres.

\* Not including in the total. — (1) Production for sale. — (2) Data published by the Reichsnährstand. — (3) Area provided for in the Plan. — (4) Average 1932, 1933, 1934 and 1936. — (5) European and native crops.

*Indochina:* Growth in Annam was good at the end of January except in some provinces where the yield of lower leaves was reduced by drought. In Cochinchina the yield of mid-season crops was satisfactory. Growth of main crop was good in both Cochinchina and Cambodia at the end of January.

*Algeria:* The weather in February was favourable for the growth of seeds in seed-beds and for the preparation of ground for planting-out. It is anticipated that transplanting will be carried out early this year.

*Nyasaland:* It was reported in January that heavy rains had adversely affected the tobacco crops.

### Current information on Other Products.

#### Cacao.

*Trinidad:* It was reported in January that cacao pickings indicated that the crop would be the lowest on record, owing to excessive rainfall.

*Gold Coast and Togoland under British Mandate:* MAIN CROP 1938-39. — During the first half of January weather conditions were very favourable for drying but only moderate for growth. The purity level was reported to remain well up to average. Exports during the first half of January were approximately 42.1 million lb. bringing the total for the 3 ½ months to about 190 million lb. Movement in the Colony was normal.

The improved weather conditions facilitated harvesting and drying with the result that about 87 per cent. of the crop had been collected by the middle of January.

The situation of the crop on January 15 was as follows:

	million lb.	% of the estimated
Exports to mid-January (excluding 31 million lb. of old crop) . . . . .	159	28
Stocks in merchants' hands . . . . .	199	36
<i>Total marketed . . . . .</i>	<i>358</i>	<i>64</i>
Stocks in farmers' hands . . . . .	130	23
<i>Total harvested . . . . .</i>	<i>488</i>	<i>87</i>
Ripe on farms (estim.) . . . . .	50	9
Still to ripen off . . . . .	22	4
<i>Total crop (estim.) . . . . .</i>	<i>560</i>	<i>100</i>

#### Tea.

*India:* In North India very little tea was plucked in December and the season has closed. There was an increase of 17,007,760 lb. on the outturn to the end of December 1937. In South India light rain fell throughout the area toward the end of December and this was considered slightly beneficial. The outturn in the South was 13.1 per cent. ahead of that to the same date last season.

*Indochina:* Picking gave poor results in January in Tonkin. Growth was checked. In Annam growth was good at the end of January.

**Coffee.**

*Brazil:* The total quantity of coffee destroyed in Brazil since 1931 to the end of February 1939 amounted to 86,382,000 centals, of which 4,680,000 were destroyed in the first eight months of the present commercial season (July 1, 1938 to February 28, 1939) and 346,000 in February. Stocks in Brazilian ports on February 28 were 4,489,000 centals, of which 3,064,000 were in Santos, 884,000 in Rio de Janeiro and the remainder in other ports.

*Netherlands Guiana:* The coffee crop this season is reported to be very small.

*Haiti:* The weather in January was favourable for coffee plantations and the condition of crops was considered good.

*Angola:* The forecasts of an average coffee crop in the 1938-39 season are confirmed.

*Tanganyika:* In January, prospects for the coming coffee season in the Arusha district were reported to be good.

*Hawaii:* According to January reports crop prospects for 1938-39 are average.

*New Caledonia:* Picking of the *Robusta* variety was assisted by fair weather. Yields this season are very high.

**Groundnuts.**

*Bulgaria:* According to the most recent estimate the, area cultivated to groundnuts in 1938 was about 7,060 acres against 7,030 in 1937 and 2,330 on the average of the five years ending 1936; percentages 100.3 and 302.8. The corresponding production is estimated at about 48,000 centals against 65,140 and 20,700; percentages, 73.6 and 231.6.

*Argentina:* Rains in January and February favoured the groundnut crops in the provinces of Santa Fé and Entre Rios and in central Córdoba. The area cultivated in the last province and in San Luis is smaller than that of last year as a result of the drought which prevailed at the time of planting. The crops in Corrientes and Tucumán were in average to good condition in February.

*United States:* The Crop Reporting Board estimates from reports on farmers' intentions that 2,319,000 acres will be planted to groundnuts in 1939. This estimate covers groundnuts grown for all purposes.

*Netherlands Indies:* Java and Madura. — The Department of Agricultural Statistics of the Central Statistical Office communicates the following details of the groundnut area:—

	1939 acres	1938 acres
Area harvested in January . . . . .	37,600	40,000
Area of standing crops at the end of January . . . . .	147,500	157,700

*Indochina:* Growth was satisfactory at the end of January in Cochinchina and Annam.

*Egypt:* According to the most recent estimate, the area cultivated to groundnuts in 1938 was about 23,800 acres against 22,900 in 1937 and 24,300 on the average of the five years ending 1936; percentages, 103.9 and 97.8. The corresponding production is estimated at about 345,600 centals, against 342,000 and 347,200; percentages 101.1 and 99.5.

### Colza and Sesame.

*Bulgaria:* According to the most recent estimate, the area cultivated to colza in 1938 was about 60,600 acres against 8,580 in 1937 and 20,810 on the average of the five years ending 1936; percentages, 706.5 and 291.2. The corresponding production is estimated at about 550,900 centals (1,101,800 bushels) against 61,500 (123,000) and 148,600 (297,200); percentages, 895.9 and 370.8.

Area cultivated to sesame in 1938 was about 4,530 acres against 13,450 in 1937 and 21,430 on the average of the five years ending 1936; percentages 33.7 and 21.1. The corresponding production is estimated at about 7,360 centals (370 short tons) against 31,080 (1,550) and 62,380 (3,120); percentages 23.7 and 11.8.

*Greece:* Area cultivated to sesame in 1938 was about 92,390 acres against 88,370 in 1937 and 91,740 on the average of the five years ending 1936, percentages 104.6 and 100.7. The corresponding production is estimated at about 127,800 centals (6,400 short tons) against 218,000 (10,900) and 174,600 (8,700); percentages, 58.6 and 73.2.

*Hungary:* At the beginning of March winter colza was in good condition. Damage due to frost and the weight of the snow was light.

*Poland:* According to the most recent estimate, the area cultivated to colza in 1938 was about 163,560 acres against 146,390 in 1937 and 105,000 on the average of the five years ending 1936; percentages, 111.7 and 155.8. The corresponding production is estimated at about 1,579,800 centals (3,159,600 bushels) against 1,169,600 (2,339,100) and 797,000 (1,594,000); percentages, 135.1 and 198.2.

*Romania:* As a result of intense frost about the middle of March, winter colza which had begun to sprout and was not protected by snow suffered serious damage.

*Egypt:* According to the most recent estimate, the area cultivated to sesame in 1938 was about 20,200 acres against 19,000 in 1937 and 19,500 on the average of the five years ending 1936; percentages, 106.0 and 103.7. The corresponding production is estimated at about 134,900 centals (6,750 short tons) against 130,300 (6,500) and 126,800 (6,300); percentages, 103.6 and 106.4.

### Current information on Fodder Crops.

*Belgium:* Clover was severely affected by the frequent night frosts of early February and was in very poor condition in the middle of the month. Part of the area was ploughed up and another part was sown with rye-grass. Meadows varied from mediocre to satisfactory. Catch crops, particularly turnips and choux moeliers, were almost entirely destroyed.

*France:* Night and morning frosts affected crops throughout February and in the beginning of March and delayed first growth. Moreover, the second half of February and the first half of March were wet. Except in certain well exposed positions stock at the end of February could still not be put out to graze.

*Hungary:* By the end of February preparation for mangel sowings had begun. Clover and alfalfa survived the winter in good conditions on the whole. The growth of permanent grass and pasture had begun in the warmer places.

*Ireland:* The weather was fine in the first ten days of February, but the rest of the month was wet. Pastures made very limited growth. Fodder supplies are smaller than usual and will be only barely sufficient to meet requirements.

The production of turnips in 1938 is estimated at 56,139,000 centals (2,807,000 short tons) against 61,289,000 (3,064,000) in 1937 and an average of 65,891,000 (3,295,000) in 1932 to 1936; percentages, 91.6 and 85.2.

The production of mangels is estimated at 34,592,000 centals (1,730,000 short tons) against 37,208,000 (1,860,000) in 1937 and an average of 36,111,000 (1,806,000) in 1932 to 1936; percentages, 93.0 and 95.8.

*Italy:* During the first half of February the fodder crops made satisfactory progress. The rains of the second half of the month brought a substantial improvement in condition.

*Latvia:* Supplies of ordinary and concentrated feed were sufficient during February. Except in the case of hay, which was below average, quality was satisfactory.

*Poland:* The following are the latest estimates of the production of certain fodder crops:—

*Grain.*

Lupin . . . . .	(000 centals)	3,757	3,193	3,235	117.6	116.1
	(000 sh. tons)	188	160	162		
Field peas . . . . .	(000 centals)	559	404	668	138.4	83.8

	(000 sh. tons)	57	49	67		
Mixture of cereals and legumes . . .	(000 centals)	1,775	1,567 (1)	1,454	113.3	122.1

*Hay.*

Field peas . . . . .	(000 centals)	368	355	736	103.7	50.1
	(000 sh. tons)	18	18	37		
Serradilla . . . . .	(000 centals)	2,005	1,341	2,897	149.5	69.2
	(000 sh. tons)	100	67	145		
Clover . . . . .	(000 centals)	75,526	42,136	53,745	179.2	140.5
	(000 sh. tons)	3,776	2,107	2,687		
Vetch and horse beans . . . . .	(000 centals)	1,104	980	2,291	112.7	48.2
	(000 sh. tons)	55	49	115		
Mixture of cereals and legumes . . .	(000 centals)	1,217	1,022 (1)	931	119.1	130.7
	(000 sh. tons)	61	51 (1)	47		
Other feed crops and mixtures . . .	(000 centals)	947	856 (1)	857	110.7	110.5
	(000 sh. tons)	47	43 (1)	43		
Permanent meadows	(000 centals)	197,168	164,110	173,571	120.1	113.6
	(000 sh. tons)	9,858	8,205	8,678		

(1) Average of 1935 and 1936.

*United Kingdom:* Winter keep has been heavily drawn upon but supplies should be adequate, except, in some districts, if spring is late.

*Argentina:* The condition of pastures at the beginning of March was excellent, following rains in February.

*Algeria:* The production of rotation crops – vetches and oats, *bersim* clover in particular – was large. Rotation meadows and pastures also made growth. lands The latter, however, are not yet sufficiently advanced, particularly on the high table and in the sublittoral area (Tell) of the département of Alger, where pastures have been flooded, and, in many cases, not available for grazings.

*Egypt:* Growth of the clover crop has been stimulated in February by adequate watering and rain. Third cutting is progressing in early areas, as also hay-making in northern districts. In Upper Egypt irrigated areas assigned to seeds are satisfactory and full of flowers.

*Tunisia:* The heavy rain and comparatively high temperature of February stimulated the growth of fodder crops. Except in flooded areas, rotation fodder crops are in good condition in the north (Bizerta and Tunis); they were making slower growth in the centre (Kef). Permanent grass was already abundant in most areas, except in the far north (1st region, Bizerta).

## LIVESTOCK AND DERIVATIVES

### Slaughterings and Meat Production in Germany in 1937 and 1938.

#### *Number of Slaughterings in Germany (1937 frontiers) <sup>1</sup>*

	Adult cattle	Cows <sup>2</sup>	Calves	Pigs	Sheep	Goats
1938 . . . . .	4,275	2,109	5,072	22,604	1,968	500
1937 . . . . .	3,856	1,971	4,960	24,738	1,650	682

(1) Including animals imported for slaughter.

(2) Included in previous column.

#### *Quantities available for consumption.*

	Beef	Veal	Pigmeat	Mutton and lamb	Goat- meat	Total
	(million lb.)					
1938 . . . . .	2,555	474	5,428	107	21	8,661
1937 . . . . .	2,161	465	5,568	91	29	8,386
	(lb. per head of the total population)					
1938 . . . . .	37.54	6.97	79.76	1.59	0.31	127.27
1937 . . . . .	31.86	6.86	82.10	1.34	0.42	123.61
	(lb. per full meat-eater)					
1938 . . . . .	51.21	9.50	108.80	2.16	0.42	173.61
1937 . . . . .	43.65	9.39	112.46	1.83	0.60	169.36

Total meat production has increased despite a slight fall in the production of pigmeat.

<i>Sheep</i>	406,000	405,000	429,000	443,797	449,077
<i>Pigs</i>	1,371,000	1,300,000	1,322,000	1,293,090	1,456,236
Young pigs and pigs for slaughter	1,239,000	1,166,000	1,181,000	1,158,555	1,312,580
Pigs for service	132,000	134,000	141,000	134,535	143,656

## Slaughterings of meat animals in Switzerland.

The statistics of slaughterings of meat animals, published regularly by the Federal Bureau of Industry, Arts, Trade and Labour for 42 towns, include about half the entire slaughterings of Switzerland; these results therefore reflect fairly accurately the general movement of meat animal slaughterings in the country.

The following table gives the data from 1927, the first year for which comparable statistics for the 42 towns are available:

Years	Number of slaughtering		Net weight of slaughtering	
	Carcasses	Index No. 1937/31 = 100	Thousand lb.	Index No. 1927/31 = 100
1938 . . . . .	697,006	104	158,945	105
1937 . . . . .	682,714	102	151,751	101
1936 . . . . .	680,500	101	154,867	103
1935 . . . . .	748,142	111	170,215	113
1934 . . . . .	730,296	109	169,078	112
1933 . . . . .	719,382	107	165,866	110
1932 . . . . .	716,837	107	155,520	103
Average 1927 to 1931 . . . . .	672,435	100	150,872	100

Between 1937 and 1938 the total number of animals slaughtered during the year rose by 14,292, or 2.1 per cent., to 697,006 and the net weight by 7,194,000 lb., or 4.7 per cent., to 158,945,000 lb. The 1938 figures are 3.7 per cent. higher in number of carcasses and 5.4 per cent. higher in net weight than the averages for 1927 to 1931.

A comparison of quarterly slaughtering between 1937 and 1938 shows wide variations. The net weight in the first quarter of 1938 was 2.5 per cent. higher than a year before, in the second quarter 1.0 per cent. lower, in the third quarter 1.2 per cent. higher, while in the last quarter slaughtering were as much as 15.4 per cent. higher, owing to an epidemic of foot-and-mouth disease. During 1938 as a whole, slaughtering made necessary by foot-and-mouth disease in Switzerland totalled 15,299 head of large stock and 9,888 head of small stock. The importance of the increase in slaughtering in 1938 may be appreciated from the fact that imports of fresh meat and hams decreased by 5,549,000 lb. between 1937 and 1938.

The following table shows comparative figures for the different categories of animals slaughtered in 1937 and 1938.

CATEGORIES OF ANIMALS	Number of slaughtering				Net weight in thousand lb.			
	January-December		Difference		January-December		Difference	
	1938	1937	absolute	%	1938	1937	absolute	%
Bulls . . . . .	13,583	21,377	— 7,794	— 36	10,960.1	17,437.5	— 6,477.4	— 37
Oxen . . . . .	6,869	13,902	— 7,033	— 51	5,345.8	10,175.2	— 4,829.4	— 47
Cows . . . . .	47,210	29,562	+ 17,648	+ 60	29,142.6	18,248.4	+ 10,894.2	+ 60
Heifers . . . . .	28,708	18,914	+ 9,794	+ 52	16,835.2	11,216.9	+ 5,618.3	+ 50
Calves . . . . .	205,208	198,358	+ 6,850	+ 3	25,334.7	24,489.3	+ 845.4	+ 3
Sheep . . . . .	38,288	38,863	— 575	— 1	1,772.5	1,799.2	— 26.7	— 1
Goats . . . . .	766	532	+ 234	+ 44	27.1	18.7	+ 8.4	+ 45
Pigs . . . . .	353,587	357,912	— 4,325	— 1	67,819.0	66,281.3	+ 1,537.7	+ 2
Horses . . . . .	2,787	3,294	— 507	— 15	1,708.1	2,084.3	— 376.2	— 18
TOTAL . . .	697,006	682,714	+ 14,292	+ 2	158,945.1	151,750.8	+ 7,194.3	+ 5

Slaughterings of bulls, oxen, cows and heifers show marked differences between the two years. In 1938 7,794 less bulls and 7,033 less oxen were slaughtered than in 1937, the fall in net weight being respectively 37 and 47 per cent. The principal reason for this drop is that imports of stock from abroad were reduced to a bare minimum. On the other hand slaughterings of cows rose by 17,648 head, or 60 per cent. in weight, and of heifers by 9,794 head, or 50 per cent. in weight. A slight increase also took place in slaughterings of calves, but a decrease in the case of pigs in spite of foot-and-mouth disease.

The differences for each category between changes in the number of carcasses and in the total net weight are due to changes in the average net weight per carcass, as shown in the following table.

	Net weight			Net weight	
	1938	1937		1938	1937
	lb.			lb.	
Bulls . . . . .	807	816	Heifers . . . . .	586	593
Oxen . . . . .	778	732	Calves . . . . .	123	123
Cows . . . . .	617	617	Pigs . . . . .	192	185

### Livestock in the U. S. S. R.

Official estimates of the numbers of livestock in the U. S. S. R. in 1937 and 1938 are given below with the figures for previous years.

Years	Horses	Cattle	Sheep and Goats	Pigs
		(thousands)		
July 1 1938: . . . . .	17,500	63,200	102,500	30,600
" " 1937 . . . . .	16,700	57,000	81,300	22,800
" " 1936 . . . . .	16,600	56,500	73,300	30,400
" " 1935 . . . . .	15,881	49,226	61,051	22,550
" " 1934 . . . . .	15,649	42,422	51,925	17,450
" " 1933 . . . . .	16,579	38,380	50,224	12,068
" " 1916 . . . . .	35,771	60,563	121,202	20,875

Favoured by the good crops of 1934-35 and 1935-36, numbers of livestock began to rise from the low levels of 1933 and 1934. The agricultural year 1936-37 was a year of relatively poor production and the increase in livestock numbers slowed down. The number of sheep and goats on July 1, 1937 increased by only 10.9 per cent., a lower rate than that shown in earlier years. There was little change in the numbers of horses and cattle while pig numbers fell by 25 per cent. The good crop of 1937-38 had favourable effects and all classes of stock increased considerably on the levels of the previous year, horses by 4.8 per cent., cattle by 10.9 per cent., sheep by 26.1 per cent. and pigs by 34.2 per cent.

The 1938 numbers, compared with those of 1916, show the following percentages:— horses 48.9, cattle 104.4, sheep and goats 84.6 and pigs 146.6.

## Livestock in the United States.

Estimates of the numbers of livestock on farms in the United States on January 1, 1939, as compiled by the Crop Reporting Board of the Bureau of Agricultural Economics, are reproduced below together with the comparative figures of the numbers on January 1 in each of the three preceding years, some of which have been revised, and the average of the ten years 1927 to 1936.

	1939	1938	1937	1936	Average 1927-36
	(Thousand head)				
Horses . . . . .	10,800	11,128	11,445	11,635	13,185
Mules . . . . .	4,382	4,428	4,568	4,684	5,227
Cattle, total . . . . .	66,821	66,083	66,803	67,929	64,511
Cows and heifers, 2 years old and over, kept for milk . . . . .	25,093	24,834	24,993	25,439	24,304
Sheep . . . . .	53,762	52,682	52,489	52,022	50,588
Pigs . . . . .	49,011	44,218	42,770	42,837	54,884
Chickens 3 months old and over . .	412,647	386,573	420,257	401,238	440,971

The figures show a general tendency to expand production of meat and animal products, all categories except horses and mules being larger than a year earlier.

The estimated number of horses, including colts, on farms on January 1, 1939, was 10,800,000 head, a decrease of 3 per cent. For the first time since 1932 the number of colts under 1 year old on January 1 was smaller than a year earlier. The number of mules, at 4,382,000 head, was down by 1 per cent. but the number of mule colts under 1 year increased further in 1938 and was the largest since 1928.

The estimated number of cattle on farms this year was 66,821,000, an increase of 738,000 head, or 1 per cent., on the number on January 1, 1938. Although numbers were up in nearly all States, sharp decreases were shown for Texas, New Mexico and Arizona from which States movements last year were of near record size. The increase this year was largely in calves and yearling heifers with the estimated number of steers somewhat smaller. The number of milk cows (cows and heifers two years old and over kept for milk) was 25,093,000 head, an increase of 259,000 head, or 1 per cent. The number of yearling heifers being kept for milk cows, at 5,138,000, was up 264,000 or 5 per cent. and the number of heifer calves being kept for milk cows of 5,635,000 was up 248,000 head.

The number of sheep and lambs, at 53,762,000, showed an increase of 1,080,000, or 2 per cent. The number of sheep and lambs on feed for market, at 5,700,000, was 297,000 head smaller than a year earlier. The number of stock sheep, at 48,062,000 head, was 1,377,000 head, or 3 per cent., larger. The increase in stock sheep was about the same both in the number of ewe lambs being kept for breeding ewes and in ewes 1 year old and over.

The estimated number of pigs on January 1 this year was 49,011,000 head, an increase of 4,793,000 head, or 11 per cent., over a year earlier. The number at the beginning of this year was the largest since 1934. All the increase was in pigs under 6 months old and in sows and gilts for breeding, with the number of other pigs smaller.

The number of chickens three months old and over on farms on January 1, 1939 was 412,647,000, an increase of 7 per cent. on the low figure for January 1, 1938.

### Milk Production in the United States.

With feed supplies ample and pastures the best in years, milk production on farms of the United States in 1938 is estimated to have reached the record level of 107,155,000,000 lb., an increase of 4 per cent. on 1937. The previous peak was 104,753,000,000 lb. in 1933, just prior to the great drought of 1934. Figures for recent years are as follows:

	Milk Cows * (thousand head)	Milk Production	
		Per Cow (lb.)	Total (million lb.)
1938 . . . . .	23,706	4,520	107,155
1937 . . . . .	23,710	4,350	103,132
1936 . . . . .	23,988	4,301	103,183
Average 1927-36 . . . . .	23,194	4,352	100,718

\* Average number during year, heifers not freshened excluded.

The increase in production over 1937 was shared by nearly all parts of the country, but was particularly sharp in some Central and Western Maize Belt States and in the Great Plains area where production was sharply reduced during the drought years. In the 10 States from Oklahoma, Colorado and Utah northward, production was lower than in some years prior to recent droughts, but elsewhere production was relatively high and in 31 States higher than in any of the 9 previous years.

Milk production per cow in 1938 is estimated to have averaged 4,520 lb., the highest since 1929. Production per cow has increased each year since 1934 when it averaged only 4,029 lb. In all groups of States production per cow in 1938 equalled or exceeded production in any year since 1929.

The average number of milk cows on farms during 1938 was practically the same as during 1937. Small increases, notably in the Atlantic Coast States from New York to Virginia, in the Pacific Northwest, and in Michigan, Wisconsin, Tennessee, Louisiana and Texas, were offset by moderate decreases elsewhere, mostly in the Northern Plains States. The number on farms during 1938 was the smallest since 1931 but the low point now appears to have been passed. Increases in the number of heifers and heifer calves kept for milk cows during the past year are expected to be reflected in increased numbers of milk cows within the next two years.

### Wool Production in the United States.

Wool production in 1938 is estimated at 436,510,000 lb. against 432,809,000 lb. in 1937. Of the total this year 372,810,000 lb. of wool were shorn and 63,700,000 lb. were pulled. The number of sheep shorn in 1938 is estimated at 46,726,000 against 45,298,000 in 1937. The average fleece weight was the same in both years 7.98 lb.

### Casein Production and International Trade.

Recent chemical research has discovered a large number of new materials, which, at first intended only for use as substitutes, have unexpectedly found entirely new uses. The elements for the production of these materials are mostly of mineral origin; a small number only are derived from agricultural products. Among the latter is casein, a by-product of butter manufacture obtained from skim milk by precipitation. Cow milk contains about 3 per cent. of casein.

The industrial production of casein was begun in the last quarter of the 19th century, but was only developed on a large scale in this century. Casein can be used for a large number of purposes. The best known and one of the most important uses is in the manufacture of galalith. Even larger quantities of casein are used in the paper industry as a size in the manufacture of glazed papers, especially for half-tone illustration and as a fixing agent in colour printing; for this purpose casein has replaced gelatine and starch. In addition, very large quantities are employed in the manufacture of cold glue used in the construction of aeroplanes. Casein is used as a binder in the manufacture of water colours and, to some extent also, of oil colours. It is used as a dressing for textiles. It is also made into medicines and food products (Santogen, Plasmon, Eucasein) and acts as a base for certain medicaments. Concentrated feed for livestock is also manufactured from casein. For human consumption it is used in ways that are not generally known to the consumer. It is an important element in many concentrated soups and is also used in baking powders for bread-making and as a filling material in sausage-making. A new method of utilizing casein is provided by the invention of Lanital or artificial wool from casein, but it is not yet possible to forecast the extent of the development of this industry. This will depend among other things on the possibility of producing the necessary casein at economic prices.

In regard to terminology, it should be noted that the term "casein" is at present used in a vague sense, sometimes covering all the different stages in the transformation of casein from its colloidal state in milk to a finished piece of galalith. This imprecision is particularly noticeable in statistical data. The caseinogen contained in milk in colloidal form may be converted into casein by various processes which result in products with different properties. From the skim milk is obtained by natural fermentation, in most cases by admixing a reagent, natural-sour casein (lactic acid) the most important quantitatively. By precipitation with rennet is obtained rennet casein which, like hydrochloric

acid casein, is used for the manufacture of galalith. There are also other processes of manufacture of casein for human consumption, for stock feed and for textile casein. Statistical returns only in exceptional cases take account of these different types.

The manufacture of casein enables the production of a non-perishable commodity from the by-products of butter manufacture. Thus the production of casein is heavily influenced by trends in butter manufacture and milk production, particularly as it may be used to absorb excess supplies of milk. Moreover, casein manufacture is sometimes only a utilization of unwanted residues when the direct use of curds, for example, in the manufacture of sour milk cheese is impossible. For this reason the large overseas butter producing countries, including the United States of America, are among the largest casein producing countries. Argentina is the principal producing country. It may therefore seem strange that the third largest producer is France, a country with dense population and with a large and world-famous production of cheeses. The explanation of France's large production of casein may partly be found in the fact that the cheeses produced are principally cheeses rich in fats. It may be noted that by contrast in Germany, where the production of milk per head of the population is about 10 per cent. higher than in France, production on a vast scale only began in the last few years as a result of import difficulties.

Production statistics are very incomplete. For Argentina, the largest exporting country, there are no production statistics. Exports figures, however, may be taken as giving an indication of production, even if their annual variations do not correspond very closely to those of production. For France also, another large exporting country, production statistics are scanty. Until recently there was only one estimate of production, a trade estimate made about 1932 giving an annual production figure of 33,000,000 lb. of which about 6,600,000 lb. was consumed in France. This indication is in accord with exports from

### *Production of Casein.*

(a) Dried. — (b) Crude.

(1) Semi-official estimates. — (2) Calculated from weekly averages. — (3) Commercial year ending on June 30 of the year indicated.

1927 to 1931, but from that year to 1938 inclusive exports have been much lower, except in 1936, when they reached 33,654,000 lb. In that year the quantity of casein used for manufacture also appears to have been particularly high, for exports under the category "hardened casein and other artificial plastics of vegetable origin" exceeded the average of 1932 to 1935 by over 50 per cent. Total production in 1936 may accordingly be estimated at over 40,000,000 lb. Casein production in 1937 is put at 27,902,000 lb. This reduction, which, judging from the export figures, was accentuated in 1938, is probably a consequence of foot-and-mouth disease.

The United States have published statistics of production for a considerable number of years. For a long time this country was one of the largest casein producers and recently has even come near to displacing Argentina as the largest producer. United States production figures, though showing more violent annual fluctuations than Argentine export figures, show a strong tendency to rise. For the last years, figures are not yet available, but the heavy reduction of imports indicates a large production. The situation in the United States is radically different from that in Argentina and France, for her own production has to be augmented by imports.

In Germany casein production, from a comparatively low level, has risen so rapidly in the last three or four years that it has passed that of all countries except Argentina, the United States and France. Production in Germany is now about half the production in France. This development is regarded in Germany as a regrettable consequence of the difficulties of foreign trade, for it would be preferred to use the material employed in casein production for human consumption. Production in 1938 was estimated before the end of the year at about 13,000,000 lb., which would only represent a slight increase on the previous year.

Production statistics for New Zealand are available only for the year 1936-37, when dairy factory production totalled 9,651,000 lb. Of this total, by far the greater part was exported, so that export figures for New Zealand may be taken as closely reflecting production. Exports in 1938 fell very heavily and reached a lower level than these of the Netherlands.

Figures for the Netherlands are only available since 1935 but prior to that year considerable quantities of casein were manufactured. The figures in the table, showing a large increase in casein manufacture, were calculated by the Institute on the basis of the weekly production figures.

In Italy, according to the Industrial Census of 1937, total dry casein production amounted to 9,920,000 lb.

Among the countries which do not publish statistics of production are the U. S. S. R. and Japan, the latter an increasingly important importing country.

A comparison of production statistics shows large fluctuations from one year to the next, which are due to the special nature of this product. In fact, in view of the conditions of casein manufacture, it is surprising that production in the various countries does not fluctuate more violently.

A typical example of a similar tendency in the production of the various continents was provided in 1936 when large outturns were recorded in most

of the important producing countries. Although supplies in general were ample, exports from Argentina and France were particularly heavy. One must conclude that production was plentiful also in these countries. These identical developments of production may be accounted for the uniformly favourable weather conditions and by the general situation of the butter market.

The total production of casein in the countries for which production or export figures are available amounted in 1936 to about 161,000,000 lb. against 128,000,000 lb. in 1935. The figure for 1933 was still lower at 117,000,000 lb. In that year the poor production of France and the United States was only partly offset by the record exports of Argentina.

The production figures generally comprise all kinds of casein but some indications of the composition of the aggregate are available. The most detailed returns are those for Germany given in the statistics of the *Hauptvereinigung der deutschen Milch und Fettwirtschaft* (German Milk and Fats Association) which may be taken as official and which are reproduced in the production table. Production in 1937 reached 13,000,000 lb. and was made up as follows:—

11,000,000 lb	of lactic acid casein;
1,000,000 „ „	edible casein;
140,000 „ „	hydrochloric acid casein;
35,000 „ „	rennet casein;
130,000 „ „	fodder casein.

The estimate for France indicates that 9,000,000 lb. of the total consist of rennet and the remaining 11,000,000 of lactic acid. In the Scandinavian countries and in Australia and New Zealand, rennet casein predominated, at least in less recent years. Argentina produces lactic acid casein almost exclusively. In the United States, according to an old estimate probably referring to 1927, about three-quarters of the casein production were used for the manufacture of casein. Lactic acid casein predominates in the proportion indicated or perhaps to a greater extent. Practically all the Italian production (9,000,000 lb. out of 10,000,000 lb.) is used for industrial purposes.

Though the composition of the total is not clear, the greater part consists of lactic acid casein.

Several countries are both importers and exporters, partly because the kinds imported are different from those exported, but in some cases the explanation is that statistics include casein and casein products in the same classification. Foreign trade statistics comprising only finished products of casein have not been taken into consideration here.

To fill up the gaps in production figures, reference has often been made to trade figures, those of exports in particular. We have seen that two of the three principal producing countries do not transform their casein, or do so only to a limited extent, while the third, the United States, appears among the importing countries. Argentina and France export large quantities varying between three-quarters and three-fifths of the total exports. Since the quantities for other countries given in the tables also include processed casein, the real share of these two countries may be even somewhat greater. Ever

since the war, Argentine exports have been greater than those of France. Very often they have been twice as large or more as in the years up to 1926 and between 1932 and 1934. In other years the difference was slight, as in 1927, 1930 and 1931. After 1933 the difference between the exports of the two countries has diminished steadily. In 1936 exports from France reached their maximum. France succeeded in securing an outlet on the North American market, mainly because the quality of her casein was better and because she could offer rennet casein. The contraction in German imports appreciably affected both countries, especially Argentina, since Germany manufactures lactic acid in particular. In addition, French rennet casein had to face competition from the Scandinavian countries.

(<sup>1)</sup> Fiscal year ending March 31 of year stated.

Another feature of trade movements was a considerable increase in the imports of the Netherlands which are both importers and exporters. Imports predominated in 1931 and 1932 but exports have increased since 1936 to such a point that they now far exceed imports. Imports do not show variations greater than those recorded in earlier years.

Exports from New Zealand fell last year, those from Norway increased while those of Italy were irregular. The German exports include certain manufactured products under casein.

The total volume of exports mainly depends on the exports of Argentina and France. The share of the other exporting countries is, however, increasing. Exports in post-war years, on the whole, show a considerable expansion. They

have risen from about 44,000,000 lb. in 1923 to 66,000,000 lb. and reached their peak (99,000,000 lb.) in 1936. The latest rise was mainly due to the heavy exports from France. Not unnaturally, there was then a change which is of particular importance because the import requirements of the chief importing country hitherto were considerably reduced, at least for some time by the expansion of its own production. In 1937, total exports were 22,000,000 lb. lower than in the previous year. This reduction was shown in the exports of France and Argentina. As we have seen from the still incomplete and partly provisional figures for 1938, there was in that year a further but less substantial reduction. This latter decline was felt by New Zealand whose exports were not half those of the preceding year.

Germany is the main importer of casein. Her position among the importing nations resembles that of Argentina among the exporters. In the record year 1934, her imports were more than half the world total. After 1936 they fell in two years to half their previous volume, being replaced by internal production. Since the total from the two sources is now smaller than the imports of earlier years, it appears that the raw materials are being utilised with moderation. In 1938 also, Germany, despite this contraction, was the largest importer

but the difference between her imports and those of the United Kingdom has become insignificant.

Japan's imports of casein have increased steadily but the available figures do not go beyond 1936. Imports increased from 4,000,000 lb. in 1930 to

10,000,000 lb. Japan is thus third among the importers. The United States, often the principal importer up to 1925, has not only given second place to the United Kingdom, except for 1936, but seems likely to disappear from the importing group owing to the increase in home production. However, in view of the sharp fluctuations in casein production, it must not be expected that the United States will cease importing entirely. There is, however, some uncertainty as to the world market in view of the parallel development of production in Germany.

On the whole, the yearly fluctuations in imports are not as wide as those in exports since exports are subject to very changeable natural factors whereas imports depend on industrial requirements which are generally more stable. The few countries which show substantial variations in their imports are those which have to supplement the national production.

W. SCHUBRING.

### Current information on Livestock and Derivatives.

*Estonia:* At the end of February milk production was higher than a month earlier. Feeding conditions were satisfactory, although carting of fodder was difficult owing to the lack of snow on the roads.

*France:* Foot-and-mouth disease is still declining but generally speaking, animals that have been affected are in rather poor condition and are only slowly recovering. Minor symptoms are rather numerous. The lack of dry fodder and the delay of growth on meadows and pastures will cause some feeding difficulties in the next two months. This situation is already reflected in the market where offers of animals are numerous.

*Ireland:* Milk production was lower in February than last year.

*Latvia:* During February, milk production increased by 5 to 10 per cent. on the preceding month and on the corresponding month in 1938.

*Netherlands:* Feeding conditions for milk cows were good in all parts of the country in February, some areas being especially favoured.

Compared with the same month last year, milk production increased by 2 per cent. in the country as a whole. In Gelderland, Utrecht, Zeeland, South Holland and North Brabant, milk production hardly differed from the normal. In Groningen, Drente, North Holland and Limburg it increased by 1 to 2 per cent. and in Friesland and Overijssel by 6 per cent.

*United Kingdom:* The health and condition of ewes were generally satisfactory in February, but in a number of districts considerable hand feeding had been necessary. Hill sheep improved in condition as a result of the mild weather. Lambing became general in February, except in the north and among hill flocks. Prospects were favourable.

Cattle and sheep have done reasonably well. Milk yields were maintained at seasonal levels with the aid of concentrates.

*Argentina:* The condition of stock at the beginning of the month was excellent.

*Canada:* Snowfall in February was unusually heavy, particularly in Eastern Canada. The Prairie Provinces also received a normal covering of snow, and the distribution was more uniform than in recent years. Farmers found it difficult to secure their hay supplies from stacks embedded in the snow and those hauling their produce over country roads experienced some trouble in making regular deliveries.

Stocks of feed were holding out well. There seemed to be a surplus of hay in northern Ontario, parts of Quebec and in the Maritimes, although some of it was of poor quality.

There was no evidence of a decline in freshenings.

As in January, milk production per cow was appreciably higher than in the corresponding month in 1938 and March is also expected to show an increase over last year.

*United States:* Milk production on February 1 was only slightly above the normal winter level but showed somewhat more than the usual seasonal increase during January in nearly all groups of States. Reports from crop correspondents also showed a production per cow on February 1 of 12.9 lb., or 5 per cent. more than a year earlier and 5 per cent. above the February 1 average for the previous ten years. In all sections of the country an unusually large percentage of the milk cows were being milked for the season and all sections, particularly the western Maize Belt and northern Great Plains were favoured by remarkably mild weather during January. The principal cause of the generally heavy production of milk per cow, however, was the low price of grain and the tendency to feed milk cows liberally in order to secure some additional income from the unusually large supply of feed grain on hand.

Allowing for a slight increase in the number of milk cows as well as for the increased production per cow, the daily volume of milk produced in the United States about February 1 was probably nearly 6 per cent. above the quantity a year earlier and larger than in other years except 1933.

*Algeria:* The situation improved somewhat during February but is still not very satisfactory owing to the lack of feed following cold and floods. Fodder supplies for animals were still, at the end of the month, insufficient in the sub-littoral (Tell) of the département of Alger, on the high tablelands and in certain parts of the South. In certain parts an abnormal mortality has occurred owing to the poor condition of animals and the consequences of parasitic diseases. A return of cold weather would seriously affect stock. No contagious disease, however, was reported on any large scale during the month.

*French Morocco:* Weather conditions in February were favourable for grazings which are improving everywhere. Feed supplies for animals are assured.

*Union of South Africa:* Conditions were generally very dry in the interior in the first three weeks of January, and some trekking was necessary. In the last week good rains fell throughout the east and most of the centre of the Union, greatly improving pastures and conditions for stock. Drought conditions prevailed in the west of Cape Province, but stock generally are still in fair condition.

### Current information on Sericulture.

*Indochina:* At the end of January, pruned mulberries were beginning to sprout in Annam. New shoots were planted in good conditions in some provinces.

\* Indicates that the rate was not quoted during part of the period under review. — n. q. = not quoted. — n. = nominal.

(1) Average rates for entire cargoes, except where otherwise stated, relating to contracts made, during periods often extending back several months, to operate during the weeks specified. — (2) Shipments of wheat and maize: Aug.-July. — (3) Rates for parcels by liners. — (4) Until Dec. 1937, rates for parcels by liners. — (5) "Down River" includes the ports of Buenos Aires, La Plata and Montevideo. — (6) "Up River" includes the ports on the Paraná River as far as San Lorenzo. Cargoes from ports beyond San Lorenzo (Colastine, Santa Fé and Paraná) are subject to an extra rate of freight. — (7) These rates refer to contracts made for shipments of wheat in bulk from South Australia (or Victoria) to the United Kingdom/Continent. They have been adjusted by the differences between the minimum rates ruling for shipments from other Australian States. The minimum rates per ton, fixed by the Tramp Shipping Administrative Committee, are: South Australia 32/-, Western Australia 31/-, New South Wales 31/6 (ex silo), 32/- (ex bags). An additional charge for bagged-wheat is fixed at 2/6 per ton in each case.

## VARIATIONS IN THE INDEX-NUMBERS OF PRICES

The index-numbers of prices of agricultural and other products of interest to the farmer, as published by the various countries, are often very heterogeneous and consequently great care has to be taken in drawing conclusions from the supplementary information given in the following comparative summary table.

COUNTRIES	Percentage variations in the index-numbers of prices of			
	agricultural products	all products	agricultural products	all products
	February 1939 in comparison with			
	January 1939		February 1938	
Germany (products sold by farmers) . . .	0.0	—	2.0	—
Germany (wholesale prices) . . . . .	0.2	0.0	2.2	+ 0.8
England and Wales (a) . . . . .	2.1	0.4	4.1	— 8.5
England and Wales (b) . . . . .	1.1	—	4.3	—
Argentina . . . . .	4.1	0.7	27.3	— 7.9
Canada . . . . .	0.2	0.1	24.0	— 12.4

# MONTHLY CROP REPORT AND AGRICULTURAL STATISTICS

---

*The following explanations refer to crop conditions quoted in the crop notes and in the tables. — Crop condition according to the system of the country: Germany, Hungary, Luxemburg and Czechoslovakia: 1 = excellent, 2 = good, 3 = average, 4 = bad, 5 = very bad; Finland: 8 = very good, 6 = above the average, 5 = average; France: 100 = excellent, 70 = good, 60 = fairly good, 50 = average, 30 = bad; Estonia, Latvia, Lithuania, Poland, Romania and Sweden: 5 = excellent, 4 = good, 3 = average, 2 = bad, 1 = very bad; Netherlands: 90 = excellent, 70 = good, 60 = fairly good, 50 = below average; Portugal: 100 = excellent, 80 = good, 60 = average, 40 = bad, 20 = very bad; Switzerland: 100 = excellent, 90 = very good, 75 = good, 60 = fairly good, 50 = average, 40 = rather bad, 30 = bad, 10 = very bad; U. S. S. R.: 5 = good, 4 = above the average, 3 = average, 2 = below average, 1 = bad; Canada: 100 = crop condition promising a yield equivalent to the average yield of a long series of years; United States: 100 = crop condition which promises a normal yield; Egypt: 100 = crop condition which promises a yield equal to the average yield of the last five years. — For other countries the system of the Institute is employed: 100 = crop condition which promises a yield equal to the average of the last ten years.*

---

**See latest information at the end of the Crop Report.**

---

## VEGETAL PRODUCTION

### The World Wheat Trade in 1938-39 and 1939 Wheat Crop Prospects.

Of the various countries which sent to the Institute during April revised estimates of their 1938 wheat production, none shows important differences compared with the previous returns. The first estimates, however, of certain minor producing countries have been received, namely Albania, Irak, Palestine, Trans-Jordan and New Zealand. These figures are all approximately as large as those which had been estimated from general reports dispatched about harvest time. Albania, Irak and New Zealand have had crops about equal to those of the previous year, while Trans-Jordan and more especially Palestine report poor crops.

The estimate of world wheat production in 1938 and the statistical position in regard to world exportable supplies and import requirements in the 1938-39 season, of which a general revision was published last month, have not been affected, except to a negligible degree, by these latest revisions and we do not consider it necessary to re-examine these figures.

The volume of international trade in February, from the latest official statistics of the principal exporting and importing countries, shows a slight decline on the average of the preceding months, the fall being mostly due to lower demand by the importing countries of the European continent. Compared with the corresponding month of last year, world exports in February show only a slight change. The aggregate exports of the first seven months of the season (August 1-February 28) are slightly (34 million bushels) higher than last season, but are very small in comparison with existing exportable stocks. The

in revising our estimate of the probable import requirements of Europe we raised our estimate to 430 million bushels, against our October forecast of 415 millions. To reach this total, the net imports of the European importing countries in the remainder of the season from March 1 to July 31, 1939 would have to

*Net Imports of Wheat into Europe (including flour in terms of wheat) \*.*  
(million bushels).

\* Aggregate net imports of normal importing countries, after deduction of exports, if any.

(1) Forecast March-October 1939. — (2) After deduction of net exports of 1 million bushels from Sweden and of 1 million bushels of net exports from Czecho-Slovakia. — (3) After deduction of net exports of 0.7 million bushels from Sweden. — (4) After deduction of net exports of 0.4 million bushels from Sweden and 0.4 million bushels from Czecho-Slovakia. — (5) After deduction of net exports of 1.5 million bushels from Czecho-Slovakia. — (6) Denmark, Estonia, Finland, Latvia, Norway and Sweden. — (7) Czecho-Slovakia, Spain, Portugal, Albania, Malta, etc.

average about 37 million bushels per month, against average imports of 35 millions in the first seven months.

The relatively poor demand in Europe in this first part of the season has been due particularly to the continental countries, the imports of which only exceeded those of last year owing to the large purchases made by Germany. The imports of the United Kingdom, in spite of the programme of building up large reserve stocks, were only 13 million bushels higher than last season.

### The Condition of standing Crops.

The condition of winter crops does not appear to be at all good in several of the important wheat growing countries of Europe. The severe frosts without any snow cover at the beginning of the winter, the subsequent excessive moisture due to heavy precipitation followed by a thaw and the sudden return

at the middle of March of winter conditions in important producing areas of France, Germany, Poland, Belgium and the Netherlands, did serious damage to crops making resowing on a vast scale necessary. The season has not been favourable for these new sowings, which have been retarded by the moist condition of the soil and where sowings were done germination was uneven. Rye appears to have resisted the bad conditions better than wheat. Prospects for these countries as a whole are pessimistic and much smaller wheat crops than last year are anticipated. The situation, however, is fairly satisfactory in most of the countries of southeastern Europe, particularly Romania and Bulgaria. Crops in Hungary have made very good growth, but towards the end of April were in need of rain. In Yugoslavia also crops were suffering from drought.

In Italy wheat crops passed the winter well and at the beginning of the spring their condition was satisfactory, although bad weather in the second half of March retarded growth and did a certain amount of damage, which does not seem, however, on the whole, to have been considerable.

In the U. S. S. R. the main features of the winter were a lack of snow and low temperatures, which froze the ground to a great depth, even in the south. Conditions, therefore, do not seem to have been favourable for winter crops. Nevertheless, Government reports at the beginning of April stated that the condition of winter cereals was good. The sowing of spring cereals, after being retarded in the second half of March by unfavourable weather, was actively resumed in the first decade of April in good conditions as regards temperature and soil humidity. On April 15 sowing was definitely in advance of last year.

In the United States, the provisional forecast, made on April 1, of winter wheat production gave a figure of 549 million bushels, which is 20 per cent. lower than last year's production (687 million bushels), but 10 per cent. higher than the previous five-year average. The first half of April was unfavourable for winter crops, owing to cold weather and excessive rain. The weather was better however in the third week. The work of sowing spring cereals has been hampered by the unfavourable season and has made rather slower progress than last year. According to the inquiry into farmers' planting intentions, the prospective acreage to be sown to spring wheat in 1939 is 19.5 million acres, or 17 per cent. less than last year's sown acreage and 13 per cent. below the previous five-year average. Soil moisture conditions, which are a very important factor in determining good spring wheat crops, appear to be favourable at the first stage of growth.

In Canada also preparations for wheat sowing have made slow progress, owing to the continuance of wintry weather as late as the middle of April. Sub-soil moisture reserves are abundant in almost all areas. It is expected in some quarters that there will be a slight decrease in the acreage, owing to the low level of prices.

In India, the crop is reported to be considerably smaller than last year's though the acreage is only slightly contracted. The prolonged drought during the winter is mainly responsible for the poor yield forecast in the first official estimate, which was recently published. Production in Punjab, which produces about a third of the total crop of India, is also considerably less than last year's.

*Wheat Production in India.*

In Japan crop condition on April 1 was about normal. In the near-eastern countries the condition of cereals was satisfactory in almost all parts.

In North Africa crop prospects are much better than last year. In Egypt maturation is taking place in favourable conditions and crop condition is good. The acreage is slightly larger. In most parts of Algeria, Morocco and Tunisia, as a result particularly of the heavy rainfall of the spring, wheat promised a very satisfactory yield on considerably larger areas.

In the Southern Hemisphere, rain in Argentina enabled a good preparation of the land for sowing. In Australia, heavy rain fell in the eastern States, while in Western Australia and South Australia there was great need of rain.

**Current information from various countries on Wheat, Rye, Barley and Oats.***Europe.*

*Bulgaria:* Cold and wet weather prevailed during March. The winter cereals came through the winter in good conditions. Spring sowings began, the work being favoured by ample moisture.

*Estonia:* The day temperature in March oscillated around freezing point. The night temperature throughout the country fell to 27° F and even to 21° F.

*Finland:* In March the temperature was 3 or 4 degrees above normal. Rainfall was about  $\frac{3}{4}$  inch.

*France:* Weather in March was cold everywhere with heavy showers and snow in areas of high and medium altitude. These conditions were quite exceptional for the south and delayed growth and field work, especially spring sowings.

At the end of the month, wheat was a very uneven crop and rather unsatisfactory on the whole. In the north and around Paris wheat was suffering from cold and an excess of moisture. The sowings made on light soils to replace those destroyed by frost were thin while on heavy soils sprouting was poor as a result of considerable rotting. In some areas, farmers will have to resow a third time. On the whole, except for sowings which had not been affected by the December frosts, there is a

serious delay in growth and mediocre yields are in prospect. In other places—the central, western, southwestern, southern, east central and eastern areas—the excess of moisture has delayed absorption of nitrogenous fertilisers and wheat has lost colour on poorly drained lands but the situation is not compromised in these areas. Though growth and tillering were delayed, winter wheat is comparatively satisfactory but growth of the newly sown wheat is slow and difficult.

Winter barley had withstood the frosts and showed vigorous growth at the end of March. Winter oats, in places where they had not been destroyed by the December frosts, were affected by unfavourable weather. As for the spring cereals, bad weather seriously impeded sowings and made germination difficult.

The first half of April was, on the whole, much more favourable, as weather was fine and mild and beneficial rain fell in the north and the Paris district in the middle of the month after a period of fine weather.

*Hungary:* During the four weeks from March 4 to April 1 the weather was rather cold. In most parts of the country precipitation was above average, and over a large area was even double the average. Between March 11 and 16 precipitation was mainly in the form of snow. Wheat, rye and barley wintered well and at the beginning of April crops were thick and of a good green colour. Growth had been retarded by cold weather and at the end of the month more warmth was needed. Damage by frost and insects was slight. At the beginning of April the sowing of spring cereals was still in progress. The growth of early seeds was retarded by the cold.

(Telegram of April 24): The seedlings have grown well but need rain.

*Ireland:* The weather in the first ten days of March was cold and unsettled, but during the remainder of the month was fine, though still cold. A fair proportion of spring cereals were sown under reasonably good conditions.

*Italy:* In the first fortnight of March the weather was variable and not at all favourable, but the crop condition of cereals was on the whole good. In some parts of North Italy, following drought and strong winds, rain was needed. The sowing of spring wheat and oats was in progress. In the second half of the month also the weather was very variable. Some damage to wheat and other winter cereals by frost and strong wind was reported. The need for rain was universal, but crops damaged were on the whole only a very small proportion of the total.

*Latvia:* The temperature in March was about normal for the time of year. About the middle of the month there was a colder spell for several days. Precipitation was on the whole below normal. On the hills there was a snow cover, but only for a few days and only 1 inch deep.

*Lithuania:* In March the temperature remained at several degrees below freezing point. Precipitation was heavy. A fairly thick snow cover remained throughout the month.

*Luxemburg:* The severe winter has seriously damaged crops in all parts of the country and winter cereals, particularly wheat, have had to be resown on a large scale.

*Poland:* According to the Central Statistical Office, the winter of 1938-39 was rather unfavourable for cereals, particularly wheat. There were severe frosts without snow in the second half of December. Snow fell at the end of that month but melted in the first half of January owing to a rise in temperature and heavy rain. These conditions continued up to the end of February. The resultant increase in moisture seriously damaged cereals, especially those on low-lying lands.

Variable weather in the first fortnight of March with snow, intermittent rains, cold winds and sharp changes between day and night temperatures aggravated, the poor

condition of the crops. During this period frost and snow prevailed in the north where fields were again entirely snow-covered at mid-March.

Rye was in better condition in the middle of March in southern districts and there was an improvement in the condition of wheat in central and western districts.

*Romania:* The last week of March was cold and wet. The crop condition of winter cereals remained good or very good in the first half of April. The preparation of the land for sowing of spring cereals was retarded or interrupted by the rain and cold. At the middle of April the sowing of barley and oats was in full swing in very favourable weather.

*United Kingdom:* The weather in March was variable. After a few days of mild weather, there was a spell of cold north and east winds over most of the country with local snow or sleet. Towards the end of the month warmer conditions returned to the south. There was a marked deficiency of sunshine in England, and more than average rainfall in the east. Wheat on the whole was satisfactory though poor in colour in some areas, and more sun was needed in parts of Scotland. Oats and barley made moderate progress, but patching and re-sowing were necessary in a number of districts.

It is believed that the acreage under winter wheat in Scotland may show a decrease on last year.

*Switzerland:* Although sown rather late in some districts, cereals have on the whole wintered well without any serious damage. In fact, in many districts rye is even

condition of the crops. During this period frost and snow prevailed in the north where fields were again entirely snow-covered at mid-March.

Rye was in better condition in the middle of March in southern districts and there was an improvement in the condition of wheat in central and western districts.

*Romania:* The last week of March was cold and wet. The crop condition of winter cereals remained good or very good in the first half of April. The preparation of the land for sowing of spring cereals was retarded or interrupted by the rain and cold. At the middle of April the sowing of barley and oats was in full swing in very favourable weather.

*United Kingdom:* The weather in March was variable. After a few days of mild weather, there was a spell of cold north and east winds over most of the country with local snow or sleet. Towards the end of the month warmer conditions returned to the south. There was a marked deficiency of sunshine in England, and more than average rainfall in the east. Wheat on the whole was satisfactory though poor in colour in some areas, and more sun was needed in parts of Scotland. Oats and barley made moderate progress, but patching and re-sowing were necessary in a number of districts.

It is believed that the acreage under winter wheat in Scotland may show a decrease on last year.

*Switzerland:* Although sown rather late in some districts, cereals have on the whole wintered well without any serious damage. In fact, in many districts rye is even

too thick. Wheat and spelt show good growth. Local damage by rodents and slugs is reported. The heavy snowfalls of March considerably retarded spring sowings so that in many areas cereals had not been sown by the end of March. However, sufficient moisture for spring sowing seems assured. The crop condition of spelt on April 1, 1939, was 83, in the system of the country, against 85 on that date last year.

*Yugoslavia:* The winter has on the whole been favourable for winter cereals, sowings of which were carried out in good conditions. The absence of floods, which commonly occur at this time of year, considerably reduced the extent of damage. But drought in the south of Sava and the Danube valley affected the condition of winter cereals.

*U. S. S. R.:* According to recently published official statistics, the acreage under wheat in the U. S. S. R. in 1937 was 102,300,000 acres against an average of 88,437,000 acres in 1932 to 1936. Total wheat production was respectively 975,300,000 centals (1,625,500,000 bushels) and 617,800,000 centals (1,029,700,000 bushels), giving yields per acre of 15.9 and 11.6 bushels respectively.

The dry summer and autumn of last year, the winter with little snow in most of the southeast and south, the low temperature of the winter which froze the ground to a great depth and the rather cold spring with changes in temperature, made it necessary to sow cereals this spring as rapidly as possible. But sowing was inevitably rather slow up to the end of March in view of unfavourable weather conditions.

In the first decade of March the weather was mild, but in the second and third decades the temperature again fell. In some areas there were rather heavy snow falls and the snow line had again moved to the south. In the first decade of April the weather was mild in the southeast and south, where sowing was resumed so rapidly that by April 10 the acreage sown was even higher than at the same date last year.

In the north the weather in the first decade of April was cold. At the beginning of the second decade the snow line passed approximately through Smolensk, Kazan and Perm, continuing also through the Asiatic Territory of the Union. The snow was still very deep in the north (Voloyda, Archangel).

The ground has thawed slowly. At the beginning of the second decade of April, in the centre there were still areas where the ground was frozen to a depth of from 2 to 3 feet and in the west and northwest from 1 to 1½ feet. In the south (Ukraine, North Caucasus) the temperature of the soil was 50° to 55° F at a depth of 4 to 6 inches.

In this period of April the weather over the greater part of Ukraine, the Volga region, Crimea and North Caucasus was fine with little precipitation, (up to ½ inch). Measurements of soil humidity made by meteorological stations, showed that in most parts of the south moisture reserves are normal — 1,600 cubic metres per hectare. These reserves ensure a good growth of plants in the south of Ukraine, in the north of the Rostov area and in the Volga region where reserves varied between 800 and 1,200 m<sup>3</sup>.

In the first decade of April there was heavy precipitation (1 to 1½ inches), in the centre mainly in the form of snow, and soil moisture reserves were augmented.

The sowing of spring cereals, which was actively resumed in the south and south-east in the first decade of April was carried out in favourable conditions as regards temperature and soil moisture. In the south of Ukraine, in the province of Rostov and in North Caucasus spring cereals are growing well, winter cereals are in good condition. According to 75 per cent. of the meteorological stations of Ukraine, the crop condition of winter cereals was good or excellent in the first decade of April, while the remaining stations recorded it as satisfactory.

In the Central Asian Republics spring cereals are growing well.

## Area and Crop Condition of Barley and Oats.

† See explanation according of the various systems, page 303. — \* Countries not included in the totals. — (a) Above the average. — (b) Average. — (c) Below the average. — (d) Very good. — (f) Average. — (w) Winter crop. — 1) Not including Austria. — 2) Acreage sown up to 1 January. — (3) 1 January 1939. — (4) Middle of the month. — (5) Area indicated for harvest, calculated on farmer's intentions on 1 March 1939. — (6) Area harvested.

In the following table are published the areas sown to spring cereals this year and in the last four years.

*Area sown to all spring crops*  
(thousands acres).

Date	1939	% of Plan	1938	% of Plan
March 15 . . . . .	...	...	1,925	0.3
" 20 . . . . .	3,163	1.5	3,568	1.7
" 25 . . . . .	5,229	2.5	7,693	4.0
April 1 . . . . .	10,379	5.0	14,394	7.0
" 5 . . . . .	16,986	8.0	18,938	9.0
" 10 . . . . .	30,891	15.0	27,313	14.0

These statistics do not include the area of individual holdings which are however of little importance as regards the cultivation of cereals. In 1938 they amounted to only 1,500, 000 acres, or 0.6 per cent. of the total area cultivated to cereals in the Union.

On April 15 the area sown to all spring cereals had risen to 44,181,000 acres, or 22 per cent. of the plan and sowing had also extended to the central region. In 1938 the area sown to the same date was 35,465,000 acres, or 17 per cent. of the plan.

#### America.

*United States:* According to the Crop Reporting Board's report on farmers' planting intentions, seedings of all spring wheat are expected to total 10,505,000 acres in 1939. This would be 17.1 per cent. less than the 23,515,000 acres seeded in 1938 and 13.3 per cent. below the 1933-37 average of 22,507,000 acres. A reduction from last year's seedings is indicated for all the important spring wheat growing States, the indicated decreases ranging from 43 per cent. in Oregon to 11 per cent. in North Dakota. East of the Mississippi River, in the less important spring wheat area, the spring wheat acreage is expected to increase slightly although most States show no change from last year. The prospective acreage for 1939 for the country as a whole is the smallest seeded in 14 years, with the exception of 1934.

The total spring wheat acreage includes 3,545,000 acres of durum wheat, a decrease of 8.1 per cent. from last year's seedings.

The acreage loss through abandonment has varied widely in the past 10 years and this wide variation makes it difficult to forecast probable harvested acreage with great accuracy. However, if the abandonment in 1939 approximates to the average of the past 10 years, excluding the heavy losses of 1934 and 1936, the indicated acreage of all spring wheat for harvest would be about 16,700,000 acres as compared with 20,510,000 acres in 1938.

Winter wheat production, on the basis of crop condition on April 1, is expected to reach 329,531,000 centals (549,219,000 bushels) compared with 411,982,000 centals (686,637,000 bushels) in 1938 and with a 1933-37 average of 298,260,000 centals (497,100,000 bushels); percentages, 80.0 and 110.5.

With the exception of California and a few scattered areas elsewhere, there has been a general improvement in winter wheat prospects since December 1. A marked improvement has occurred in the Southern Great Plains area where dry weather at and following seeding resulted in generally poor prospects last autumn even though subsoil moisture conditions were generally better than for some years. Although

somewhat dry, the winter was generally favourable in this area and March rainfall was above normal, resulting in much improvement. Although improved over last December, prospective yields in the Central and Southern Plains area, with the exception of Oklahoma, are still below average. Elsewhere indicated yields are mostly average or better with the exception of California where the winter was dry. The critically dry conditions there were relieved in most areas in March. In the Eastern Maize Belt the spring is late but winter wheat development has been good.

Reports on April 1 indicated that about 16 per cent. of the acreage seeded last autumn would not be harvested. This leaves about 38,900,000 acres for harvest in 1939 compared with 49,711,000 acres harvested last year.

The winter was favourable for the rye crop, the condition at 79 per cent., of normal on April 1 being 3 points above that of December 1, whereas the average change for the last ten years has been a decline of 3 points between the two dates. In the West North Central Region, which includes the most important rye producing States, the mild winter has resulted in marked improvement in condition over that of December 1 which, however, was below average following the dry autumn. Growth is well advanced in Nebraska and has started in South Dakota. Over most of this area soil moisture is sufficient for present needs but more will be needed soon.

The prospective seedings of barley in 1939 are estimated at 13,219,000 acres. This is a 16.6 per cent. increase on 1938. A marked increase is planned in the winter wheat States from Nebraska to Texas and eastward to the Appalachian Mountains. In the spring wheat States, from the Dakotas to Michigan, more moderate increases are contemplated. In California an increase of 15 per cent. is expected. Although barley is a relatively unimportant crop in other parts of the country, increases, some very appreciable, are reported for practically all States.

Abandonment of barley in 1938 was about 7 per cent. of the planted acreage. This was about an average abandonment exclusive of the years 1933, 1934 and 1936. If an abandonment of 7 per cent. be assumed for 1939 the area left for harvest would amount to 12,294,000 acres compared with 10,513,000 harvested in 1938.

The prospective seedings of oats are estimated at 35,393,000 acres. This is a decrease of 3.3 per cent. from the 36,615,000 acres seeded in 1938 and would be the smallest planting of oats since 1909.

In the North Central States, which have approximately three-fourths of the country's oats acreage, prospective plantings indicate a decrease of 5.0 per cent. from those in 1938. All other sections report some decrease. The intended plantings in the North Atlantic States show an increase of 0.6 per cent., the South Atlantic States an increase of 4.3 per cent., the South Central States an increase of 0.5 per cent. and the Western States an increase of 8.8 per cent.

Assuming an abandonment of 3.3 per cent., the average of the past ten years exclusive of 1934 and 1936, the oats acreage for harvest would amount to 34,225,000 acres compared with 35,477,000 acres harvested in 1938.

The first half of April was generally unfavourable for agriculture owing to cold and excessive moisture. Spring operations were delayed and winter wheat, though satisfactory early in the month, declined in condition. Crops in the south and south-west, however, were making fair progress.

## Asia.

*India:* Crop condition in the Punjab on April 3 was average to good in irrigated areas and under average to average in unirrigated areas; some damage had been caused by hail in Shahpur, Jhelum and Gurgao and by rust in Mianwali and parts of Jhang.

There was general rain in the week ending March 27 and rain in all districts except Gujrat and Ludhiana in the following week.

In the Central Provinces in the fortnight ending March 25 the sky was cloudy and there were light showers and hailstorms but in the following week there was hot weather with scattered rain. There was rust in the late-sown crop in Jubbulpore.

(Telegram of April 20): According to the third estimate, the area cultivated to wheat this year in the Punjab is about 9,738,000 acres against 10,472,000 in 1937-38 and 10,307,000 on the average of the five years ending 1936-37, percentages 93.0 and 94.5. The corresponding production is estimated at about 74,440,000 centals (124,100,000 bushels) against 83,730,000 (139,600,000) and 77,320,000 (128,900,000); percentages 88.9 and 96.3.

(Telegram of April 21): The first estimate of Indian wheat production in the current year is 206,640,000 centals (344,400,000 bushels), compared with a corresponding estimate of 228,190,000 (380,310,000) last year, a decrease of 9.4 per cent. Compared with the corresponding average of 219,720,000 (366,200,000) for the five years ending 1937 the decrease is 6.0 per cent.

*Japan:* Despite the unfavourable weather of the first days of April, winter wheat and barley are in normal condition.

*Palestine:* During March wet conditions and cold weather prevailed until the last week of the month. Crops have wintered in excellent conditions. There were no losses, and all crops show strong forward growth. No diseases were noted save a slight attack of *Scythris temperatella* which was negated by a good growing season and the March rains.

## Africa.

*Algeria:* Weather conditions in March were at first dry and cold, with some frost. Later there was heavy rain with hail. Precipitation for the whole month was above the normal. On the whole, wheat maintained satisfactory condition despite a little rust and discoloration in low lying areas. Growth was rather forward at the end of March except in high areas where tillering had not occurred. Barley and early wheat had begun to ear. Whiteworm did little damage and the effect of the frosts was also slight. Part of the early sowings, however, was weed infested.

An expansion of 5 to 10 per cent. in sowings is confirmed. Crop condition of all cereals on April 1 was fair to good and better than it was at the same date last year.

*Egypt:* Weather conditions, though, fickle on certain days, were favourable for the growth of wheat crops. Growth of grains is progressing in general areas. Maturation is progressing in early areas in Upper Egypt. The crop is normal. Early areas of barley crops in Lower Egypt are progressing towards maturity. Harvesting of early areas in Upper Egypt was started at the beginning of the month. The crop is normal.

*French Morocco:* Weather conditions since the beginning of the agricultural year have been distinctly favourable for crops which now promise exceptional results in most regions and fair outturns in the less favoured.

Earing began early in the month in the south and southwest where harvesting of barley had begun in the first days of April. Crops in these areas seem assured, with prospective yields far above the average. Elsewhere, condition holds out good hopes. Violent, hot winds (*chergui*) in the middle of March, however, caused scorching

of the extremities of the plant and of ears in flower, particularly in the Rharb plain. The extent of the damage is not yet clear.

Cleaning of fields proceeded during February and throughout March. Labour and equipment were engaged on the preparation of fields to be sown in the spring and on ploughed fallow.

### Current information on Maize.

*Hungary:* At the end of March preparations for maize sowing were in progress.

*Italy:* Land intended for maize was prepared in good conditions during March.

*Romania:* At the middle of April the sowing of maize in the Danube valley had begun.

*Argentina:* The first estimate of the 1938-39 maize crop (see table) indicates an increase of about 22 million centals (39.5 million bushels) or 22.1 per cent. on the unusually low final figure for last year but it is still definitely below (— 39.6 per cent.) the average of the years 1932-33 to 1936-37.

The disappointing prospects of the year are largely due to the reduction in the cultivated area compared with 1937-38 (— 14.5 per cent.) and the average (— 20.0 per cent.). This decrease is the result of the unfavourable weather conditions, particularly drought and high temperatures, which prevailed at sowing-time.

These unfavourable conditions persisted in some maize areas during the period of growth, causing rather serious damage and reducing unit yields.

*United States:* The prospective acreage of maize to be planted in 1939, as indicated in the Crop Reporting Board's report on farmers' intentions, is 92,062,000 acres, or 1.3 per cent. below the 93,257,000 acres planted in 1938 and 8.6 per cent. below the average planted area of the five years 1933 to 1937 (100,720,000 acres). This would be the smallest acreage planted to maize in about 40 years.

With the exception of Kansas, all States of the Maize Belt show decreases from last year ranging from 1 to 9 per cent. Decreases are also expected in the South Atlantic and Western groups of States. In the North Atlantic and South Central groups of States no change from last year is indicated.

During the past 10 years the percentage of maize acreage abandoned has varied from 0.1 per cent. in 1929 to 7.5 per cent. in each of the two severe drought years 1934 and 1936. Assuming an abandonment in 1939 of 1.6 per cent., which is the same as that of 1938 and about the average for the period 1929-38, excluding the heavy losses of 1934 and 1936, the probable acreage for harvest in 1939 would be about 90,600,000 acres. Such an acreage would be the smallest acreage for harvest since 1898 and would be approached in recent years only by the 1938 acreage.

*Netherlands Indies:* Java and Madura. — The Department of Agricultural Statistics of the Central Statistical Office communicates the following details on the maize area:—

	1938 acres	1937 acres
Area harvested in February . . . . .	1,150,300	896,500
Area harvested from January 1 to February 28 . . . . .	1,942,000	1,604,700
Area of standing crops at the end of February . . . . .	775,400	979,500

*Indochina:* The harvesting of maize was in progress in February in Cambodia and Cochinchina. Yields on the whole were poor. In Tonkin seeds sprouted well.

† The years indicated are those of the harvest, single years referring to the Northern Hemisphere, double years to the Southern. — \* Not included in the total. — § In calculating the totals account has been taken of the probable area cultivated in some countries for which estimates of production are available but not those of area. — (†) Including Austria. — (2) Estimation for the old territory. — (3) Area sown. — (4) Maize sown in spring. — (5) Maize sown in summer. — (6) Crop grown alone. — (7) Mixed crop. — (8) Average 1934 to 1936. — (9) Area fixed by the plan. — (10) Average 1932 to 1935. — (11) Maize for all purposes. — (12) Maize harvested as grain. — (13) Including Tigris. — (14) *Nili* maize. — (15) *Sefi* maize. — (16) Cultivation by Europeans. — (17) Maize and sorghum. — (18) Area harvested. — (19) Cultivation by natives. — (20) Unofficial figure.

In Annam second season sowings were in progress. First season maize was in process of ear formation, which was poor in many cases owing to drought and it is feared that yields will be low.

*French Morocco:* February maize sowings, having sprouted badly, were repeated in many districts in the south and were still in progress in the centre and north.

*Union of South Africa:* There was heavy rain throughout February in Transvaal, Orange Free State and Natal. In Transvaal and Natal severe floods did considerable damage to the maize crop, and lands were too wet to cultivate. Provided however that warm weather should follow, prospects were promising for a heavy crop. In the Orange Free State maize crops were exceptionally promising.

### Current information on Rice.

*Italy:* Preparations for rice sowing were made during March in good conditions.

*India:* In Bengal light to moderate rain fell in some districts in the four weeks ending April 5 and more rain was badly needed for cultivation. In the same period there was light rain in most districts of Bihar, where crops were in fair condition, and of Orissa. In Assam the weather up to April 10 had been dry and prospects were unsatisfactory.

In the Central Provinces in the fortnight ending March 25 the sky was cloudy and there were light showers and hailstorms, but in the following week there was hot weather with scattered rain.

In Madras sowing was going on; there had been light to moderate rain in the Centre, the Circars and the Carnatic.

*Netherlands Indies:* Java and Madura. — The Department of Agricultural Statistics of the Central Statistical Office communicates the following details on the rice area:—

	1938 acres	1937 acres
<i>Area harvested in February:—</i>		
Wet padi . . . . .	165,800	172,700
Dry padi . . . . .	59,600	76,900
<i>Area harvested from January 1 to February 28:—</i>		
Wet padi . . . . .	321,500	310,900
Dry padi . . . . .	76,100	94,900
<i>Area of standing crops at the end of February:—</i>		
Wet padi . . . . .	6,750,800	6,723,100
Dry padi . . . . .	836,200	847,100

*Indochina:* The condition of rice crops in February in the different territories of the Union, except Laos, was as follows.

In North Annam planting out was finished during the second half of the month. In Central and South Annam, crops were beginning to be affected by drought, particularly third month rice. In the far south twelfth month rice had been harvested with average yields.

In Cambodia the growth of dry season rice was normal. The acreage planted out seemed to be larger than in previous years.

In Cochinchina the harvesting of mid-season rice was finished in all provinces with yields varying from good to excellent. The harvesting of main season rice was in progress and that of late rice had begun in some districts. The growth of the latter was good. Flooded land rice was planted out.

In Tonkin, under the influence of favourable weather, plants sprouted vigorously on both high and low-lying rice fields. Weeding and manuring were begun.

*British Malaya:* It was reported in January that in Kedah and Kelantan, as well as in some parts of Penang and Province Wellesley, harvesting had already commenced and crop prospects were good except in late planted areas. In Negri Sembilan harvesting was well advanced and an average crop was expected. In the Panchang Bedena area of Selangor the appearance of the crop was promising and water supplies were ample. During the month transplanting was undertaken in some of the higher areas which were previously dry, but sufficient seedlings to complete the planting were not available owing to the advanced age of the nursery material. In the Kuala Lumpur district preparations were being made for sowing nurseries in February.

### Current information on Potatoes.

*France:* Field work was delayed by unfavourable weather in March and by the necessity to resow cereal areas destroyed by the frosts. The first half of April, however, was favourable for work on the land. Early potato plantings were made in Brittany on an area slightly smaller than last year's owing to difficulties in obtaining seed potatoes.

*Hungary:* At the end of March the selection of tubers and preparation of the land for potato planting were in progress. The plantings of early varieties and germinated varieties were being carried out.

*Italy:* The planting of main season potatoes was in progress in the first half of March, while that of early varieties was well advanced. Unfavourable weather did same damage to crop in the second half of the month.

*Poland:* Severe frost, without snow cover, in the second half of December caused the freezing of potatoes in silos.

*Argentina:* The results of the lifting of early varieties varied from average to excellent in Buenos Aires Province. Prospects in the other producing centres are generally good.

*United States:* The Crop Reporting Board estimates, on the basis of farmers' planting intentions at March 1, that potato plantings this year will cover about 3,076,000 acres compared with 3,069,000 acres planted last year and with a 1933-37 average planted area of 3,445,000 acres.

*Algeria:* The production of early winter potatoes, which are reserved for export, is estimated at 1,731,000 centals (2,884,000 bushels) against 1,470,000 (2,450,000) in 1938 and an average of 995,000 (1,658,000) in 1933 to 1937; percentages, 117.7 and 173.9. The yield per acre is not very high, crops having suffered in March from frosts and hail. The increase in production is due principally to an increase in acreage to 25,500, acres, which is 46.2 per cent. higher than in 1938 and 52.5 per cent. higher than the average.

## The Acreage under Sugar-beet in 1939.

Estimates of sugar-beet acreage this year for nearly all the countries of Europe have now been received by the Institute. For the present German Reich, for the territory of the former Czecho-Slovakia and for Spain the estimates of F. O. Licht have been adopted.

For the U. S. S. R. the figures are those of the Plan.

For other continents the only figures available are those of Canada and Japan.

In the great majority of countries, and in all the important producing nations, the acreage to be cultivated to sugar-beet is larger than last year. In certain countries the acreage is more or less unchanged, and in very few is it lower.

The aggregate area under sugar-beet in Europe, excluding the U. S. S. R., is, according to these preliminary estimates, 3 per cent. larger than the 1938 figure and 17 per cent. larger than the average of 1932-1936.

\* Approximate data. — a) Not including U. S. S. R. — b) Including U. S. S. R. — (1) Licht's estimate.

Since 1935 the sugar-beet area in Europe, excluding the U. S. S. R., has been steadily increasing, and has now nearly returned to the record figure of 1930. If the U. S. S. R. is included, the present aggregate figure is the highest since the War.

Beet sowing is finished in all the countries of southern Europe and has made good progress in the remainder, but is generally rather late owing to delay in preparing the ground caused by cold weather and rain at the end of March.

### Current information on Sugar.

*France:* Field work was delayed by unfavourable weather in March and by the necessity to resow cereal areas destroyed by the frosts. The first half of April, however, was fine, sunny and favourable for work on the land. Early potato plantings were made in Brittany on an area slightly smaller than last year's owing to difficulties in obtaining seed potatoes.

### *Production of Beet-sugar (raw).*

*Hungary:* At the end of March the land was being prepared for sugar-beet planting, which had begun locally.

*Italy:* The planting of sugar-beet began in the first half of March. The cold weather did same damage to crops in the second half of the month.

*Argentina:* The condition of sugar-beet crops was good in March in the irrigated areas of Buenos Aires province and average in the valley of the Rio Negro.

Prospects for sugar-cane in March were excellent throughout the country.

*Production of Cane-sugar.*

(1) Approximate data.

*Barbados:* The good rains which were experienced generally throughout the Island during February were beneficial to the cane crop.

*Leeward and Windward Islands:* It was reported in February that cane grinding had started in Antigua and St. Kitts. In St. Lucia the young sugar canes were progressing favourably and preparations were being made for the coming crop.

*Trinidad:* It was reported in February that the sugar crop was proceeding normally with all factories grinding, and it was stated that if the favourable weather continued the crop should be completed in record time.

*Netherlands Indies: Java.* — In the first half of April, rains were light. Work was impeded by a shortage of labour at Sidoardjo and by drought. The dry weather however, was favourable for the ripening of canes in young plantations. Comparatively high yields are reported from various districts. (Aneta)

*Indochina:* In February the planting of cane was in progress in Annam and Cochin-China under good conditions. The cutting of cane on old plantations was carried out rapidly in view of the rise in price of sugar and early maturity due to the drought.

The sugar yield was lower than normal.

*Egypt:* Early planting of sugar cane is over. General planting, hoeing, watering and manuring are progressing. Germination and growth are satisfactory. The old crop has been cut to the extent of 85 per cent. Owing to the high water level on Qena crop during the Nile flood the average yield per acre was 5 per cent. below normal.

*Mauritius:* Steady rains fell during February, but it was estimated that previous drought conditions had damaged 25 per cent. of the new crop.

## Viticultural Area and Production in the Northern Hemisphere in 1938.

The Institute received during April a number of estimates which enable the completion of the statistical tables and a revision of the estimates of aggregate area and production.

In regard to *wine production*, the latest figures from Bulgaria (production of wine grapes, converted into wine by a standard co-efficient), Hungary, Romania and Yugoslavia accentuate the impression, already received, of a heavy over-production of wine in Europe. Moreover, the third partial enquiry among Californian wineries indicates that wine production in the United States is rather higher than had been estimated on the basis of the quantity of wine grapes to be used industrially, according to the Prorate Program.

The estimate of production of wine in the Northern Hemisphere is still subject to revision, in the absence of statistics for Spain, and in view of the doubtful interpretation of the figure for Italy and the preliminary nature of certain other estimates, specially for Portugal. Nevertheless, the totals show with a fair degree of accuracy the size of wine production in the Northern Hemisphere. The latest revisions show that only Italy and the importing countries of central Europe have had smaller vintages than the average of 1929-34 or than their normal consumption.

In supplementation of the survey of the United States wine market, given in last month's Crop Report, it should be noted that the volume of wine stocks

(1) Average 1935 and 1936. — (2) Calculated from an average quantity of 12.7 lb. per Imp. gal. (10.6 lb. per Am. gal.) and a total production of wine of 1,340,000,000 Imp. gal. (1,610,000,000 Am. gal.). — (3) Production of the table grape vines, representing roughly the commercial crop marketed fresh for direct consumption.

reached the extremely high figure of 7,911,000 Imperial (9,500,000 American) gallons against 1,740,000 (2,102,000) in 1937-38 and an average of 1,282,000 (1,540,000) in the four preceding seasons. The consumption of these alcohols reached a maximum of 1,116,000 (1,340,000) gallons in 1937 and 907,000 (1,090,000) in 1938. These figures show that the programme in operation included both the fixing of quotas of grapes used industrially for wine making and the reabsorption to a great extent of the crop of grapes for wine by means of distillation.

(a) Vines bearing only. — (b) Vines bearing and not bearing.

(1) Average 1935 and 1936. — (2) The declared area corresponds to declarations of wine production. The undeclared area represents the gap between preliminary figures and complete estimates. The latter only are comparable. The numbers of viticulturists who made crop declarations were: 1,575,000 in 1938, 1,615,000 in 1937, and an average of 1,541,000 in the five years ending 1936. — (3) Figures for the three preceding years are not comparable. The comparable figures for 1929, given by the *Catàsto agrario*, are 2,313,000 and 7,374,000 acres. — (4) Area of vines and other associated crops. The vines actually occupy  $\frac{1}{10}$  of this area. — (5) European crops almost exclusively for wine.

The production of table grapes can at present only be estimated for a number of countries. The outturn is rather mediocre in France, Hungary and Cyprus, but rather large in the other principal producing countries, Italy, Bulgaria, Greece and the United States. On the aggregate, production does not appear to be quite so abundant as that of grapes for wine. The total production of table grapes consumed fresh in Italy, France, Bulgaria, Greece, Hungary and

Albania was 16,003,000 centals against 15,592,000 centals in 1937 and an average of 16,200,000 centals in 1932-1936. The rather poor quality of the vintage in many cases explains this lower commercial production.

The *production of dried grapes* seems to have been comparatively much larger. The aggregate figure for Greece, the United States, Cyprus and Italy is 9,700,000 centals against 9,167,000 in 1937 and an average of 8,389,000 in 1932-1936. Moreover Turkey exported 1,786,000 centals in 1938 against 635,000 in 1937 and an average of 1,285,000 in 1932-1936 (with a maximum of 1,684,000 in 1935). Assuming that the latter country exports about three quarters of her annual production, it may be estimated approximately that the production of dried grapes in the Northern Hemisphere was about 20 per cent. higher than in 1937 and the preceding five-year average and that it represents an absolute maximum for the post-War period.

In regard to the *area under vines*, the table shows that the rise in productive area continued in most countries, though at a declining rate. Appreciable reductions however in the area of vines for wines are shown for Yugoslavia and French Morocco. Moreover there was also a reduction, which though slight shows a trend, in Germany and Switzerland. It may be assumed that the area of vines for wine in bearing in the Northern Hemisphere remained about stationary and that there was not any extensive new plantation. On the other hand, the area under vines for table grapes, fresh or for drying, appears to have increased.

Briefly, as far as one can tell from the information available, the productivity of vines does not seem to have varied greatly in the last two years, but there was a slight increase, particularly in the case of vines for fresh or dried table grapes.

P. V.

### Current information on Vines.

*France:* The weather in March was cold and wet even in the south and caused a delay in growth and work. Pruning was nearly finished at the end of the month but field work was progressing slowly. The first half of April was fine and much more favourable. Owing to the lateness of budding, it was still difficult at the end of March to estimate the damage caused by the winter frosts but the effects appeared serious in some areas. The lateness of growth, however, will probably mitigate the effect of spring frosts.

*Italy:* Vines were backward at the end of March and some damage was done in Sicily by hail, wind and frosts.

*Argentina:* In March the picking of all varieties of grapes was in progress in the principal viticultural centres. In Mendoza yields were generally high, except in districts affected by hail.

The condition of vineyards in the irrigated zone of San Juan had improved and the grape crop was considered satisfactory. In the Rio Negro valley results are good.

*United States:* The following is a summary of the Third Annual Wine Industry Statistical Survey for California. This inquiry is unofficial but covers 773 bonded wineries, storerooms and other bonded premises, and we give for comparison official statistics for the whole of the United States in preceding years.

† Must coefficient used for the totals: Germany 93 %, Greece 100 % (weight into volume), Hungary and Luxembourg 94 %.

(1) Excluding the *land* of Austria. — (2) Approximate estimate. — (3) Incomplete average; Spain 1932/1935, United States 1933/1936, Union of South Africa 1929-30/1931-32. — (4) Crop declarations for tax purposes. Incomplete figures, the total production being about 66,000,000 Imp. gallons larger. — (5) Not comparable with previous figures, owing to changes in statistical methods. — (6) Adjusted total allowing for the statistical deviation in the data of Italy. — (7) Incomplete, preliminary and unofficial figures, according to the third Annual Survey made by the California Wine Institute. — (8) Including musts "mutés" by means of alcohol.

The production of fortified wines is considerably less than in 1937 (— 37.6 per cent.), while that of dry wines has fallen off to a lesser extent (— 26 per cent.). On the basis that it requires two gallons of dry wine to produce one gallon of fortified wine, the outturn of fermented juice from pressing appears to be about 36 per cent. lower than in 1937. Moreover the report of the inquiry indicates that the provisional figure of dry wine production will probably be considerably reduced.

On the basis of these statistics, it may be estimated that total wine production in 1938 in wineries in the United States as a whole was about 110 to 130 million Imperial gallons (130-160 million American gallons), and total production including home production at 130-150 millions (160-180 millions).

*Algeria:* March was at first cold and dry with frosts. The second fortnight however, was continuously wet with heavy rain and hail. Frost did comparatively slight damage owing to the general lateness of growth. Budding began to be general towards the end of March. Rain and the fear of another drop in the temperature have retarded work in the vineyards.

### Current information on Olives.

*Albania:* The production of olives in 1938-39 is about 263,300 cents against 778,400 in 1937-38 and an average of 457,100 in the five years ending 1936-37; percentages 33.8 and 57.6.

*France:* At the end of March olive pruning was in full swing. This operation was being very widely carried out owing to the bonuses offered and the rise in price of olive-oil.

*Italy:* During the first half of March olive trees were in good condition and seasonal work was proceeding normally. Snow and winds caused some damage in the second half. Conditions were rather good, on the whole, at the end of the month.

Definitive estimates of area and production of olives and olive-oil in 1938-39 compared with the figures of 1937-38 and the average of the years 1935-36 and 1936-1937 (1932-33 to 1936-37 for olive-oil), are shown below:—

	1938-39	1937-38	Average 1935-36 and 1936-37	% 1938-39 1937-38 = 100	% 1938-39 Average = 100

*Argentina:* The olive crop this season is normal.

*Algeria:* The heavy rains of the second half of March provided sub-soil reserves which will be favourable for future growth. Flowering, pruning and soil work were impeded, however, by the cold, unfavourable weather and trees were backward at the end of the year.

## Current information on Flax.

*Hungary:* The preparation of the land for flax sowing was in progress at the end of March, and sowing had begun locally.

*Italy:* Flax sowing was nearly completed in the early part of March.

*United States:* The prospective acreage of flax to be planted for seed in 1939 is 2,023,000 acres, an increase of 84.6 per cent. over the 1,096,000 acres seeded in 1938. Although the indicated acreage to be seeded greatly exceeds that of last year, it is 19.2 per cent. below the 1929-1938 average seeded acreage.

Expansion of the flax acreage has been encouraged by comparatively favourable prices, by favourable provisions under the Agricultural Conservation programme and by the reduction in wheat acreage. A sharp increase in flax seedings is expected in all important wheat States. The percentage increase in North Dakota is not as great as that in surrounding States, probably because of the fear of grasshopper prevalence, which is especially harmful to flax. The crop is gaining prominence in California where the expected seeding is nearly threefold the acreage seeded in 1938.

*India:* Crop condition was reported in mid-March to be fairly good.

## Current information on Cotton.

*Italy:* The preparation of the land for cotton sowing was carried out in March.

*U. S. S. R.:* In Uzbekistan which is the principal cotton producing centre of the U. S. S. R., cotton production and yields in the last five years were as follows:—

Years	Yield per acre in lb. of unginned cotton	Production of unginned cotton 000 lb.
		3,316,204
		3,358,533
1938 . . . . .	1,463	3,342,440
1937 . . . . .	1,436	2,387,173
1936 . . . . .	1,445	1,627,017
1935 . . . . .	1,035	
1934 . . . . .	705	

In the first decade of April cotton sowing had begun in many areas under favourable weather conditions. After a short period of low temperatures and of rain, cotton sowing was resumed in Turkestan. On April 10, collective holdings had sown about 500,000 acres, or twice as much as last year at this date.

*Argentina:* Heavy rain in the second half of February throughout the cotton zone considerably improved the condition of crops. The January drought did some damage in parts of the Chaco. The condition of plantations in March was considered good.

*United States:* Some fields were seeded in the south-eastern portion of the belt during the week ended March 21, and good field preparation was reported in the western Gulf area. Planting was active in southern Texas, and some plants were coming up. During the following week some cotton was seeded in the eastern part of the belt as far north as the coastal districts of South Carolina, and also in the eastern Gulf sections. Good progress with planting was made in southern Texas, where some cotton was up, with nice stands in the extreme southern sections. Field preparations were advancing rapidly towards the north. During the week ended April 5 good advance was made with cotton planting in much of the south-eastern part of the

belt. Planting begun locally as far north as the extreme south-eastern portion of North Carolina. The soil in most of the central States was too wet for field work, while planting in the north-eastern portion of Texas was being delayed by wet soil and by dryness in much of the South. The condition of the early crop in the extreme south of Texas was fair to good. During the week ending April 12 extensive and substantial rainfall together with cool temperatures, retarded preparations for the cotton crop in the northern part of the belt. A little planting was accomplished in the eastern part of the belt, as far north as the coastal plains of North Carolina, but in the central and northern parts of the belt planting of cotton had not yet begun. Early planted cotton was withstanding the drought fairly well in the southern coastal plains, but much of the crop was deteriorating in the lower part of the Rio Grande Valley. During the week ended April 19 the soil was too wet in the northern part of the cotton belt, but crops were making fair progress in the south and south-west.

*British West Indies:* Area and production of cotton (season August 1-July 31) are estimated as follows:—

	1938-39	1937-38	Average 1932-33 to 1936-37	% 1938-39 1937-38 = 100	% 1938-39 Average = 100

(1) Average of two seasons: 1935-36 and 1936-37.

*Montserrat:* According to the latest estimate, the area cultivated to cotton for the 1939-40 is about 4,500 acres against 4,453 in 1938-39 and 3,731 on the average of the five years ending 1937-38; percentages 101.1 and 120.6. The corresponding production of ginned cotton is forecast at about 6,750 centals (1,410 bales of 478 lb.) against 5,415 (1,133) and 6,984 (1,461); percentages 124.7 and 96.7.

*Indochina:* In February the sprouting and growth of cotton plants were good on the whole in Annam. In Cambodia picking was nearly finished on the red soil lands, where yields were average, and was beginning on the river banks, where yields seem likely to be very poor.

*Egypt:* Up to the middle of March weather conditions were unfavourable to growth, particularly in Lower Egypt. Consequently, the area sown in Southern Delta was 12 per cent. less than last year. However, sowing progressed so well during the latter half of the month that it amounted to 65 per cent. of the allotted area in Delta North, and 85 per cent. in Upper Egypt (Girga excepted), and was nearly over in Delta South and Middle Egypt (Fayoum excepted). Resowing was about 10 per cent. in Lower Egypt, exceeding 20 per cent. in early areas. In Upper Egypt, however, resowing did not exceed 5 per cent. On the whole, germination and growth were satisfactory. Sowing is being finished. Resowing, hoeing and watering are progressing. Thinning of early areas has been started in a few localities.

Cotton ginned up to the end of March, in bales of 478 lb. net weight, was as follows:

Varieties	1939	1938	1937	1936	1935	1934	1933
